Affine Arithmetic

Fabian Immler

September 1, 2025

Abstract

We give a formalization of affine forms [1, 2] as abstract representations of zonotopes. We provide affine operations as well as overapproximations of some non-affine operations like multiplication and division. Expressions involving those operations can automatically be turned into (executable) functions approximating the original expression in affine arithmetic.

Moreover we give a verified implementation of a functional algorithm to compute the intersection of a zonotope with a hyperplane, as described in the paper [3].
