

# Bondy's Theorem

Jeremy Avigad and Stefan Hetzl

October 13, 2025

## Abstract

A proof of Bondy's Theorem following Bollobás [1].

**theory** *Bondy*  
**imports** *Main*  
**begin**

**lemma** *card-less-if-surj-not-inj*:  
   $\llbracket \text{finite } A; f \text{ ' } A = B; \neg \text{inj-on } f \text{ } A \rrbracket \implies \text{card } B < \text{card } A$   
   $\langle \text{proof} \rangle$

**theorem** *Bondy* :  
  **assumes**  $\forall A \in F. A \subseteq X$  **and**  $\text{card } X \geq 1$  **and**  $\text{card } F = \text{card } X$   
  **shows**  $\exists D. D \subseteq X \ \& \ \text{card } D < \text{card } X \ \& \ \text{card } (\text{inter } D \text{ ' } F) = \text{card } F$   
   $\langle \text{proof} \rangle$

**end**
