## Abstract

This document presents the mechanised proofs of two popular theorems attributed to Augustin Louis Cauchy - Cauchy's Mean Theorem and the Cauchy-Schwarz Inequality.

### Chapter 1

## Cauchy's Mean Theorem

theory CauchysMeanTheorem imports Complex-Main begin

#### 1.1 Abstract

The following document presents a proof of Cauchy's Mean theorem formalised in the Isabelle/Isar theorem proving system.

Theorem: For any collection of positive real numbers the geometric mean is always less than or equal to the arithmetic mean. In mathematical terms:

$$\sqrt[n]{x_1 x_2 \dots x_n} \le \frac{x_1 + \dots + x_n}{n}$$

We will use the term *mean* to denote the arithmetic mean and *gmean* to denote the geometric mean.

Informal Proof:

This proof is based on the proof presented in [1]. First we need an auxiliary lemma (the proof of which is presented formally below) that states:

Given two pairs of numbers of equal sum, the pair with the greater product is the pair with the least difference. Using this lemma we now present the proof -

Given any collection C of positive numbers with mean M and product P and with some element not equal to M we can choose two elements from the collection, a and b where a > M and b < M. Remove these elements from the collection and replace them with two new elements, a' and b' such that a' = M and a' + b' = a + b. This new collection C' now has a greater product P' but equal mean with respect to C. We can continue in this fashion until we have a collection  $C_n$  such that  $P_n > P$  and  $M_n = M$ , but  $C_n$  has all its elements equal to M and thus  $P_n = M^n$ . Using the definition of geometric and arithmetic means above we can see that for any collection of positive

elements E it is always true that gmean  $E \leq \text{mean E}$ . QED.

[1] Dorrie, H. "100 Great Problems of Elementary Mathematics." 1965, Dover.

#### 1.2 Formal proof

#### 1.2.1 Collection sum and product

The finite collections of numbers will be modelled as lists. We then define sum and product operations over these lists.

#### Sum and product definitions

```
notation (input) sum-list (\langle \sum : \rightarrow [999] 998)
notation (input) prod-list (\langle \prod : \rightarrow [999] 998)
```

#### Properties of sum and product

We now present some useful properties of sum and product over collections.

These lemmas just state that if all the elements in a collection C are less (greater than) than some value m, then the sum will less than (greater than) m \* length(C).

```
lemma sum-list-mono-lt [rule-format]:

fixes xs::real list

shows xs \neq [] \land (\forall x \in set \ xs. \ x < m)

\longrightarrow ((\sum :xs) < (m*(real \ (length \ xs))))

\langle proof \rangle
```

```
 \begin{array}{l} \textbf{lemma} \ sum\text{-}list\text{-}mono\text{-}gt \ [rule\text{-}format]\text{:}} \\ \textbf{fixes} \ ss::real \ list \end{array}
```

```
shows xs \neq [] \land (\forall x \in set \ xs. \ x > m)

\longrightarrow ((\sum :xs) > (m*(real \ (length \ xs))))
```

proof omitted

 $\langle proof \rangle$ 

If a is in C then the sum of the collection D where D is C with a removed is the sum of C minus a.

```
\mathbf{lemma} \ \mathit{sum-list-rmv1} :
```

```
a \in set \ xs \Longrightarrow \sum : (remove1 \ a \ xs) = \sum : xs - (a :: 'a :: ab-group-add) \langle proof \rangle
```

A handy addition and division distribution law over collection sums.

lemma list-sum-distrib-aux:

```
shows (\sum :xs/(n :: 'a :: archimedean-field) + \sum :xs) = (1 + (1/n)) * \sum :xs \langle proof \rangle

lemma remove1-retains-prod:
fixes a and xs::'a :: comm\text{-}ring\text{-}1 \ list
shows a \in set \ xs \longrightarrow \prod :xs = \prod :(remove1 \ a \ xs) * a
(is ?P \ xs)
\langle proof \rangle
```

The final lemma of this section states that if all elements are positive and non-zero then the product of these elements is also positive and non-zero.

```
lemma el-gt0-imp-prod-gt0 [rule-format]:
fixes xs::'a :: archimedean\text{-}field list
shows \forall y.\ y \in set\ xs \longrightarrow y > 0 \Longrightarrow \prod :xs > 0
\langle proof \rangle
```

#### 1.2.2 Auxiliary lemma

This section presents a proof of the auxiliary lemma required for this theorem.

```
lemma prod-exp:
fixes x::real
shows 4*(x*y) = (x+y)^2 - (x-y)^2
\langle proof \rangle

lemma abs-less-imp-sq-less [rule-format]:
fixes x::real and y::real and z::real and w::real assumes diff: abs (x-y) < abs (z-w)
shows (x-y)^2 < (z-w)^2
```

The required lemma (phrased slightly differently than in the informal proof.) Here we show that for any two pairs of numbers with equal sums the pair with the least difference has the greater product.

```
lemma le-diff-imp-gt-prod [rule-format]: fixes x::real and y::real and z::real and w::real assumes diff: abs (x-y) < abs (z-w) and sum: x+y = z+w shows x*y > z*w \langle proof \rangle
```

#### 1.2.3 Mean and GMean

Now we introduce definitions and properties of arithmetic and geometric means over collections of real numbers.

#### Definitions

Arithmetic mean

#### definition

```
mean :: (real \ list) \Rightarrow real \ \mathbf{where}
mean \ s = (\sum : s \ / \ real \ (length \ s))
Geometric \ mean
\mathbf{definition}
gmean :: (real \ list) \Rightarrow real \ \mathbf{where}
gmean \ s = root \ (length \ s) \ (\prod : s)
```

#### **Properties**

 $\langle proof \rangle$ 

Here we present some trivial properties of mean and gmean.

```
lemma list-sum-mean:
```

```
fixes xs::real list
 shows \sum :xs = ((mean \ xs) * (real \ (length \ xs)))
lemma list-mean-eq-iff:
 fixes one::real list and two::real list
 assumes
   se: (\sum :one = \sum :two) and
   le: (length \ one = length \ two)
 shows (mean \ one = mean \ two)
\langle proof \rangle
lemma list-gmean-gt-iff:
 fixes one::real list and two::real list
 assumes
   gz1: \prod :one > 0 and gz2: \prod :two > 0 and
   ne1: one \neq [] and ne2: two \neq [] and
   pe: (\prod : one > \prod : two) and
   le: (length \ one = length \ two)
 shows (gmean \ one > gmean \ two)
```

This slightly more complicated lemma shows that for every non-empty collection with mean M, adding another element a where a=M results in a new list with the same mean M.

```
lemma list-mean-cons [rule-format]:

fixes xs::real\ list

shows xs \neq [] \longrightarrow mean\ ((mean\ xs)\#xs) = mean\ xs

\langle proof \rangle
```

For a non-empty collection with positive mean, if we add a positive number to the collection then the mean remains positive.

```
lemma mean-gt-\theta:
assumes xs \neq [] \ \theta < x \text{ and } mgt\theta: \theta < mean \ xs
shows \theta < mean \ (x \# xs)
```

 $\langle proof \rangle$ 

#### **1.2.4** *list-neg*, *list-eg*

This section presents a useful formalisation of the act of removing all the elements from a collection that are equal (not equal) to a particular value. We use this to extract all the non-mean elements from a collection as is required by the proof.

#### **Definitions**

*list-neq* and *list-eq* just extract elements from a collection that are not equal (or equal) to some value.

#### abbreviation

```
list-neq :: ('a \ list) \Rightarrow 'a \Rightarrow ('a \ list) where list-neq \ xs \ el == filter \ (\lambda x. \ x \neq el) \ xs
```

#### abbreviation

```
list-eq :: ('a list) \Rightarrow 'a \Rightarrow ('a list) where list-eq xs el == filter (\lambda x. x=el) xs
```

#### **Properties**

 $\mathbf{lemma}\ prod ext{-}list ext{-}split:$ 

This lemma just proves a required fact about list-neq, remove1 and length.

```
lemma list-neq-remove1 [rule-format]:

shows a \neq m \land a \in set \ xs

\longrightarrow length \ (list-neq \ (remove1 \ a \ xs) \ m) < length \ (list-neq \ xs \ m)

(is ?A xs \longrightarrow ?B \ xs is ?P xs)

\langle proof \rangle
```

We now prove some facts about list-eq, list-neq, length, sum and product.

```
lemma list-eq-sum [simp]:
fixes xs::real list
shows \sum :(list-eq\ xs\ m)=(m*(real\ (length\ (list-eq\ xs\ m))))
\langle proof \rangle
lemma list-eq-prod [simp]:
fixes xs::real list
shows \prod :(list-eq\ xs\ m)=(m\ \widehat{\ (length\ (list-eq\ xs\ m)))}
\langle proof \rangle
lemma sum-list-split:
fixes xs::real list
shows \sum :xs=(\sum :(list-neq\ xs\ m)+\sum :(list-eq\ xs\ m))
\langle proof \rangle
```

```
fixes xs::real\ list

shows \prod :xs = (\prod :(list-neq\ xs\ m) * \prod :(list-eq\ xs\ m))

\langle proof \rangle

lemma sum-list-length-split:

fixes xs::real\ list

shows length\ xs = length\ (list-neq\ xs\ m) + length\ (list-eq\ xs\ m)

\langle proof \rangle
```

#### 1.2.5 Element selection

We now show that given after extracting all the elements not equal to the mean there exists one that is greater then (or less than) the mean.

```
lemma pick-one-gt:
    fixes xs::real list and m::real
    defines m: m \equiv (mean \ xs) and neq: noteq \equiv list-neq \ xs \ m
    assumes asum: noteq \neq []
    shows \exists \ e. \ e \in set \ noteq \ \land \ e > m
\langle proof \rangle

lemma pick-one-lt:
    fixes xs::real list and m::real
    defines m: m \equiv (mean \ xs) and neq: noteq \equiv list-neq \ xs \ m
    assumes asum: noteq \neq []
    shows \exists \ e. \ e \in set \ noteq \ \land \ e < m
\langle proof \rangle
```

#### 1.2.6 Abstract properties

In order to maintain some comprehension of the following proofs we now introduce some properties of collections.

#### **Definitions**

het: The heterogeneity of a collection is the number of elements not equal to its mean. A heterogeneity of zero implies the all the elements in the collection are the same (i.e. homogeneous).

#### definition

```
het :: real \ list \Rightarrow nat \ \mathbf{where} het \ l = length \ (list-neq \ l \ (mean \ l)) \mathbf{lemma} \ het-gt-0-imp-noteq-ne: \ het \ l > 0 \Longrightarrow list-neq \ l \ (mean \ l) \neq [] \langle proof \rangle \mathbf{lemma} \ het-gt-0I: \mathbf{assumes} \ a \in set \ xs \ b \in set \ xs \ a \neq b \mathbf{shows} \ het \ xs > 0
```

```
\langle proof \rangle
```

 $\gamma$ -eq: Two lists are  $\gamma$ -equivalent if and only if they both have the same number of elements and the same arithmetic means.

#### definition

```
\gamma-eq :: ((real\ list)*(real\ list)) \Rightarrow bool\ \mathbf{where}
\gamma-eq a \longleftrightarrow mean\ (fst\ a) = mean\ (snd\ a) \land length\ (fst\ a) = length\ (snd\ a)
```

 $\gamma$ -eq is transitive and symmetric.

lemma 
$$\gamma$$
-eq-sym:  $\gamma$ -eq  $(a,b) = \gamma$ -eq  $(b,a)$   $\langle proof \rangle$ 

lemma  $\gamma$ -eq-trans:

$$\gamma$$
-eq  $(x,y) \Longrightarrow \gamma$ -eq  $(y,z) \Longrightarrow \gamma$ -eq  $(x,z)$   
 $\langle proof \rangle$ 

pos: A list is positive if all its elements are greater than 0.

#### definition

```
pos :: real list \Rightarrow bool where

pos l \longleftrightarrow (if \ l = [] \ then \ False \ else \ \forall \ e. \ e \in set \ l \longrightarrow e > 0)

lemma pos-empty [simp]: pos [] = False \ \langle proof \rangle

lemma pos-single [simp]: pos [x] = (x > 0) \ \langle proof \rangle

lemma pos-imp-ne: pos xs \Longrightarrow xs \neq [] \ \langle proof \rangle

lemma pos-cons [simp]:

xs \neq [] \Longrightarrow pos \ (x \# xs) = (if \ (x > 0) \ then \ pos \ xs \ else \ False)
```

#### **Properties**

 $\langle proof \rangle$ 

Here we prove some non-trivial properties of the abstract properties.

Two lemmas regarding *pos*. The first states the removing an element from a positive collection (of more than 1 element) results in a positive collection. The second asserts that the mean of a positive collection is positive.

```
lemma pos-imp-rmv-pos:
```

```
assumes (remove1 a xs)\neq[] pos xs shows pos (remove1 a xs) \langle proof \rangle
```

```
lemma pos-mean: pos xs \Longrightarrow mean \ xs > 0 \langle proof \rangle
```

We now show that homogeneity of a non-empty collection x implies that its product is equal to  $(mean \ x)$   $(length \ x)$ .

```
lemma prod-list-het\theta:
```

```
shows x \neq [] \land het x = 0 \Longrightarrow [] : x = (mean x) \land (length x)
```

```
\langle proof \rangle
```

Furthermore we present an important result - that a homogeneous collection has equal geometric and arithmetic means.

```
lemma het-base:

assumes pos \ x \ het \ x = 0

shows gmean \ x = mean \ x

\langle proof \rangle
```

#### 1.2.7 Existence of a new collection

We now present the largest and most important proof in this document. Given any positive and non-homogeneous collection of real numbers there exists a new collection that is  $\gamma$ -equivalent, positive, has a strictly lower heterogeneity and a greater geometric mean.

```
lemma new-list-gt-gmean:
fixes xs :: real list and m :: real
and neq and eq
defines

m: m \equiv mean \ xs and
neq: noteq \equiv list-neq \ xs m and
eq: eq \equiv list-eq \ xs m
assumes pos-xs: pos \ xs and het-gt-\theta: het \ xs > \theta
shows
\exists \ xs'. \ gmean \ xs' > gmean \ xs \wedge \gamma - eq \ (xs',xs) \wedge het \ xs' < het \ xs \wedge pos \ xs'
\langle proof \rangle
```

Furthermore we show that for all non-homogeneous positive collections there exists another collection that is  $\gamma$ -equivalent, positive, has a greater geometric mean and is homogeneous.

```
lemma existence-of-het0: shows p = het \ x \Longrightarrow p > 0 \Longrightarrow pos \ x \Longrightarrow (\exists \ y. \ gmean \ y > gmean \ x \land \gamma - eq \ (x,y) \land het \ y = 0 \land pos \ y) \land proof \rangle
```

#### 1.2.8 Cauchy's Mean Theorem

We now present the final proof of the theorem. For any positive collection we show that its geometric mean is less than or equal to its arithmetic mean.

theorem CauchysMeanTheorem:

```
fixes z::real list
assumes pos z
shows gmean z \le mean z
\langle proof \rangle
```

In the equality version we prove that the geometric mean is identical to the arithmetic mean iff the collection is homogeneous.

```
theorem CauchysMeanTheorem-Eq: fixes z::real list assumes pos\ z shows gmean\ z=mean\ z\longleftrightarrow het\ z=0 \langle proof \rangle corollary CauchysMeanTheorem-Less: fixes z::real list assumes pos\ z and het\ z>0 shows gmean\ z< mean\ z \langle proof \rangle end
```

## Chapter 2

# The Cauchy-Schwarz Inequality

theory CauchySchwarz imports Complex-Main begin

#### 2.1 Abstract

The following document presents a formalised proof of the Cauchy-Schwarz Inequality for the specific case of  $\mathbb{R}^n$ . The system used is Isabelle/Isar.

Theorem: Take V to be some vector space possessing a norm and inner product, then for all  $a, b \in V$  the following inequality holds:  $|a \cdot b| \leq ||a|| * ||b||$ . Specifically, in the Real case, the norm is the Euclidean length and the inner product is the standard dot product.

#### 2.2 Formal Proof

#### 2.2.1 Vector, Dot and Norm definitions.

This section presents definitions for a real vector type, a dot product function and a norm function.

#### Vector

We now define a vector type to be a tuple of (function, length). Where the function is of type  $nat \Rightarrow real$ . We also define some accessor functions and appropriate notation.

type-synonym  $vector = (nat \Rightarrow real) * nat$ 

#### definition

```
ith :: vector \Rightarrow nat \Rightarrow real (\langle ((-) \_) \rangle [80,100] \ 100) where ith \ v \ i = fst \ v \ i
```

#### definition

```
vlen :: vector \Rightarrow nat  where vlen v = snd  v
```

Now to access the second element of some vector v the syntax is  $v_2$ .

#### Dot and Norm

We now define the dot product and norm operations.

#### definition

```
dot :: vector \Rightarrow vector \Rightarrow real (infixr \leftrightarrow 60) where dot a b = (\sum j \in \{1..(vlen a)\}. a_j * b_j)
```

#### definition

```
norm :: vector \Rightarrow real (\langle \| - \| \rangle 100) where norm \ v = sqrt \ (\sum j \in \{1..(vlen \ v)\}, \ v_j \hat{\ }^2)
```

Another definition of the norm is  $||v|| = sqrt (v \cdot v)$ . We show that our definition leads to this one.

```
 \begin{array}{l} \textbf{lemma} \ norm\text{-}dot \text{:} \ \|v\| = sqrt \ (v \cdot v) \\ \langle proof \rangle \end{array}
```

A further important property is that the norm is never negative.

#### lemma norm-pos:

```
||v|| \ge 0
\langle proof \rangle
```

We now prove an intermediary lemma regarding double summation.

lemma double-sum-aux:

```
fixes f::nat \Rightarrow real shows (\sum k \in \{1..n\}. (\sum j \in \{1..n\}. f k * g j)) = (\sum k \in \{1..n\}. (\sum j \in \{1..n\}. (f k * g j + f j * g k) / 2)) \langle proof \rangle
```

The final theorem can now be proven. It is a simple forward proof that uses properties of double summation and the preceding lemma.

 ${\bf theorem}\ {\it CauchySchwarzReal}:$ 

```
fixes x::vector

assumes vlen \ x = vlen \ y

shows |x \cdot y| \le ||x|| * ||y||

\langle proof \rangle
```

#### $\quad \mathbf{end} \quad$
