A Probabilistic Proof of the Girth-Chromatic Number Theorem

Lars Noschinski

Abstract

This works presents a formalization of the Girth-Chromatic number theorem in graph theory, stating that graphs with arbitrarily large girth and chromatic number exist. The proof uses the theory of Random Graphs to prove the existence with probabilistic arguments and is based on [1].

1 Auxilliary lemmas and setup

This section contains facts about general concepts which are not directly connected to the proof of the Chromatic-Girth theorem. At some point in time, most of them could be moved to the Isabelle base library.

Also, a little bit of setup happens.
