

Knight’s Tour Revisited Revisited

Lukas Koller
Department of Informatics
Technical University of Munich

September 26, 2023

Abstract

This is a formalization of the article “Knight’s Tour Revisited” by Cull and De Curtins where they prove the existence of a Knight’s path for arbitrary $n \times m$ -boards with $\min(n, m) \geq 5$. If $n \cdot m$ is even, then there exists a Knight’s circuit.

A Knight’s Path is a sequence of moves of a Knight on a chessboard s.t. the Knight visits every square of a chessboard exactly once. Finding a Knight’s path is a an instance of the Hamiltonian path problem.

During the formalization two mistakes in the original proof were discovered. These mistakes are corrected in this formalization.

1 Introduction and Definitions

A Knight's path is a sequence of moves on a chessboard s.t. every step in sequence is a valid move for a Knight and that the Knight visits every square on the boards exactly once. A Knight is a chess figure that is only able to move two squares vertically and one square horizontally or two squares horizontally and one square vertically. Finding a Knight's path is an instance of the Hamiltonian Path Problem. A Knight's circuit is a Knight's path, where additionally the Knight can move from the last square to the first square of the path, forming a loop.

Cull and De Curtins [1] prove the existence of a Knight's path on a $n \times m$ -board for sufficiently large n and m . The main idea for the proof is to inductively construct a Knight's path for the $n \times m$ -board from a few pre-computed Knight's paths for small boards, i.e. 5×5 , 8×6 , ..., 8×9 . The paths for small boards are transformed (i.e. transpose, mirror, translate) and concatenated to create paths for larger boards.

While formalizing the proofs I discovered two mistakes in the original proof in [1]: (i) the pre-computed path for the 6×6 -board that ends in the upper-left (in Figure 2) and (ii) the pre-computed path for the 8×8 -board that ends in the upper-left (in Figure 5) are incorrect: on the 6×6 -board the Knight cannot step from square 26 to square 27; in the 8×8 -board the Knight cannot step from square 27 to square 28. In this formalization I have replaced the two incorrect paths with correct paths.

A square on a board is identified by its coordinates.

type-synonym $square = int \times int$

A board is represented as a set of squares. Note, that this allows boards to have an arbitrary shape and do not necessarily need to be rectangular.

type-synonym $board = square\ set$

A (rectangular) $(n \times m)$ -board is the set of all squares (i, j) where $1 \leq i \leq n$ and $1 \leq j \leq m$. $(1, 1)$ is the lower-left corner, and (n, m) is the upper-right corner.

definition $board :: nat \Rightarrow nat \Rightarrow board$ **where**

$$board\ n\ m = \{(i, j) \mid i\ j.\ 1 \leq i \wedge i \leq int\ n \wedge 1 \leq j \wedge j \leq int\ m\}$$

A path is a sequence of steps on a board. A path is represented by the list of visited squares on the board. Each square on the $(n \times m)$ -board is identified by its coordinates (i, j) .

type-synonym $path = square\ list$

A Knight can only move two squares vertically and one square horizontally or two squares horizontally and one square vertically. Thus, a knight at position (i, j) can only move to $(i \pm 1, j \pm 2)$ or $(i \pm 2, j \pm 1)$.

definition $valid\ step :: square \Rightarrow square \Rightarrow bool$ **where**

$$valid\ step\ s_i\ s_j \equiv (case\ s_i\ of\ (i, j) \Rightarrow s_j \in \{(i+1, j+2), (i-1, j+2), (i+1, j-2), (i-1, j-2), (i+2, j+1), (i-2, j+1), (i+2, j-1), (i-2, j-1)\})$$

Now we define an inductive predicate that characterizes a Knight's path. A square s_i can be pre-pended to a current Knight's path $s_j \# ps$ if (i) there is a valid step from the square s_i to the first square s_j of the current path and (ii) the square s_i has not been visited yet.

inductive $knights\ path :: board \Rightarrow path \Rightarrow bool$ **where**

$$\begin{aligned} & knights\ path\ \{s_i\}\ [s_i] \\ | & s_i \notin b \Longrightarrow valid\ step\ s_i\ s_j \Longrightarrow knights\ path\ b\ (s_j \# ps) \Longrightarrow knights\ path\ (b \cup \{s_i\}) \\ & (s_i \# s_j \# ps) \end{aligned}$$

code-pred $knights\ path$ $\langle proof \rangle$

A sequence is a Knight's circuit iff the sequence is a Knight's path and there is a valid step from the last square to the first square.

definition $knights\ circuit\ b\ ps \equiv (knights\ path\ b\ ps \wedge valid\ step\ (last\ ps)\ (hd\ ps))$

2 Executable Checker for a Knight's Path

This section gives the implementation and correctness-proof for an executable checker for a knights-path w.r.t. the definition $knights\ path$.

2.1 Implementation of an Executable Checker

fun *row-exec* :: *nat* \Rightarrow *int set* **where**
row-exec 0 = {}
| *row-exec* m = *insert* (*int* m) (*row-exec* (m-1))

fun *board-exec-aux* :: *nat* \Rightarrow *int set* \Rightarrow *board* **where**
board-exec-aux 0 M = {}
| *board-exec-aux* k M = {(*int* k,j) | j. j \in M} \cup *board-exec-aux* (k-1) M

Compute a board.

fun *board-exec* :: *nat* \Rightarrow *nat* \Rightarrow *board* **where**
board-exec n m = *board-exec-aux* n (*row-exec* m)

fun *step-checker* :: *square* \Rightarrow *square* \Rightarrow *bool* **where**
step-checker (i,j) (i',j') =
((i+1,j+2) = (i',j') \vee (i-1,j+2) = (i',j') \vee (i+1,j-2) = (i',j') \vee (i-1,j-2) = (i',j'))
 \vee (i+2,j+1) = (i',j') \vee (i-2,j+1) = (i',j') \vee (i+2,j-1) = (i',j') \vee (i-2,j-1) = (i',j'))

fun *path-checker* :: *board* \Rightarrow *path* \Rightarrow *bool* **where**
path-checker b [] = *False*
| *path-checker* b [s_i] = ({s_i} = b)
| *path-checker* b (s_i#s_j#ps) = (s_i \in b \wedge *step-checker* s_i s_j \wedge *path-checker* (b - {s_i}) (s_j#ps))

fun *circuit-checker* :: *board* \Rightarrow *path* \Rightarrow *bool* **where**
circuit-checker b ps = (*path-checker* b ps \wedge *step-checker* (last ps) (hd ps))

2.2 Correctness Proof of the Executable Checker

lemma *row-exec-leq*: j \in *row-exec* m \longleftrightarrow 1 \leq j \wedge j \leq *int* m
⟨*proof*⟩

lemma *board-exec-aux-leq-mem*: (i,j) \in *board-exec-aux* k M \longleftrightarrow 1 \leq i \wedge i \leq *int* k \wedge j \in M
⟨*proof*⟩

lemma *board-exec-leq*: (i,j) \in *board-exec* n m \longleftrightarrow 1 \leq i \wedge i \leq *int* n \wedge 1 \leq j \wedge j \leq *int* m
⟨*proof*⟩

lemma *board-exec-correct*: *board* n m = *board-exec* n m
⟨*proof*⟩

lemma *step-checker-correct*: *step-checker* s_i s_j \longleftrightarrow *valid-step* s_i s_j
⟨*proof*⟩

lemma *step-checker-rev*: *step-checker* (i,j) (i',j') \implies *step-checker* (i',j') (i,j)

<proof>

lemma *knights-path-intro-rev*:

assumes $s_i \in b$ *valid-step* s_i s_j *knights-path* $(b - \{s_i\})$ $(s_j \# ps)$

shows *knights-path* b $(s_i \# s_j \# ps)$

<proof>

Final correctness corollary for the executable checker *path-checker*.

lemma *path-checker-correct*: *path-checker* b $ps \longleftrightarrow$ *knights-path* b ps

<proof>

corollary *knights-path-exec-simp*: *knights-path* $(board\ n\ m)$ $ps \longleftrightarrow$ *path-checker* $(board-exec\ n\ m)$ ps

<proof>

(proof)

lemma *knights-path-non-nil*: $\text{knights-path } b \ ps \implies ps \neq []$
(proof)

lemma *knights-path-set-eq*: $\text{knights-path } b \ ps \implies \text{set } ps = b$
(proof)

lemma *knights-path-subset*:
 $\text{knights-path } b_1 \ ps_1 \implies \text{knights-path } b_2 \ ps_2 \implies \text{set } ps_1 \subseteq \text{set } ps_2 \iff b_1 \subseteq b_2$
(proof)

lemma *knights-path-board-unique*: $\text{knights-path } b_1 \ ps \implies \text{knights-path } b_2 \ ps \implies b_1 = b_2$
(proof)

lemma *valid-step-neq*: $\text{valid-step } s_i \ s_j \implies s_i \neq s_j$
(proof)

lemma *valid-step-non-transitive*: $\text{valid-step } s_i \ s_j \implies \text{valid-step } s_j \ s_k \implies \neg \text{valid-step } s_i \ s_k$
(proof)

lemma *knights-path-distinct*: $\text{knights-path } b \ ps \implies \text{distinct } ps$
(proof)

lemma *knights-path-length*: $\text{knights-path } b \ ps \implies \text{length } ps = \text{card } b$
(proof)

lemma *knights-path-take*:
assumes $\text{knights-path } b \ ps \ 0 < k \ k < \text{length } ps$
shows $\text{knights-path } (\text{set } (\text{take } k \ ps)) \ (\text{take } k \ ps)$
(proof)

lemma *knights-path-drop*:
assumes $\text{knights-path } b \ ps \ 0 < k \ k < \text{length } ps$
shows $\text{knights-path } (\text{set } (\text{drop } k \ ps)) \ (\text{drop } k \ ps)$
(proof)

A Knight's path can be split to form two new disjoint Knight's paths.

corollary *knights-path-split*:

assumes *knights-path* b ps $0 < k$ $k < \text{length } ps$
shows
 $\exists b_1 b_2. \text{knights-path } b_1 (\text{take } k \text{ } ps) \wedge \text{knights-path } b_2 (\text{drop } k \text{ } ps) \wedge b_1 \cup b_2 = b$
 $\wedge b_1 \cap b_2 = \{\}$
<proof>

Append two disjoint Knight's paths.

corollary *knights-path-append*:

assumes *knights-path* b_1 ps_1 *knights-path* b_2 ps_2 $b_1 \cap b_2 = \{\}$ *valid-step* (*last* ps_1) (*hd* ps_2)
shows *knights-path* $(b_1 \cup b_2)$ $(ps_1 @ ps_2)$
<proof>

lemma *valid-step-rev*: *valid-step* s_i $s_j \implies \text{valid-step } s_j$ s_i
<proof>

Reverse a Knight's path.

corollary *knights-path-rev*:

assumes *knights-path* b ps
shows *knights-path* b $(\text{rev } ps)$
<proof>

Reverse a Knight's circuit.

corollary *knights-circuit-rev*:

assumes *knights-circuit* b ps
shows *knights-circuit* b $(\text{rev } ps)$
<proof>

lemma *knights-circuit-rotate1*:

assumes *knights-circuit* b $(s_i \# ps)$
shows *knights-circuit* b $(ps @ [s_i])$
<proof>

A Knight's circuit can be rotated to start at any square on the board.

lemma *knights-circuit-rotate-to*:

assumes *knights-circuit* b ps *hd* $(\text{drop } k \text{ } ps) = s_i$ $k < \text{length } ps$
shows $\exists ps'. \text{knights-circuit } b \text{ } ps' \wedge \text{hd } ps' = s_i$
<proof>

For positive boards (1,1) can only have (2,3) and (3,2) as a neighbour.

lemma *valid-step-1-1*:

assumes *valid-step* $(1,1)$ (i,j) $i > 0$ $j > 0$
shows $(i,j) = (2,3) \vee (i,j) = (3,2)$
<proof>

lemma *list-len-g-1-split*: $\text{length } xs > 1 \implies \exists x_1 x_2 xs'. xs = x_1 \# x_2 \# xs'$
 ⟨proof⟩

lemma *list-len-g-3-split*: $\text{length } xs > 3 \implies \exists x_1 x_2 xs' x_3. xs = x_1 \# x_2 \# xs' @ [x_3]$
 ⟨proof⟩

Any Knight's circuit on a positive board can be rotated to start with (1,1) and end with (3,2).

corollary *rotate-knights-circuit*:

assumes *knights-circuit* (board n m) ps $\min n m \geq 5$

shows $\exists ps. \text{knights-circuit } (board\ n\ m)\ ps \wedge \text{hd } ps = (1,1) \wedge \text{last } ps = (3,2)$

⟨proof⟩

4 Transposing Paths and Boards

4.1 Implementation of Path and Board Transposition

definition *transpose-square* $s_i = (\text{case } s_i \text{ of } (i,j) \Rightarrow (j,i))$

fun *transpose* :: $\text{path} \Rightarrow \text{path}$ **where**

$\text{transpose } [] = []$

| $\text{transpose } (s_i \# ps) = (\text{transpose-square } s_i) \# \text{transpose } ps$

definition *transpose-board* :: $\text{board} \Rightarrow \text{board}$ **where**

$\text{transpose-board } b \equiv \{(j,i) \mid i\ j. (i,j) \in b\}$

4.2 Correctness of Path and Board Transposition

lemma *transpose2*: $\text{transpose-square } (\text{transpose-square } s_i) = s_i$

⟨proof⟩

lemma *transpose-nil*: $ps = [] \longleftrightarrow \text{transpose } ps = []$

⟨proof⟩

lemma *transpose-length*: $\text{length } ps = \text{length } (\text{transpose } ps)$

⟨proof⟩

lemma *hd-transpose*: $ps \neq [] \implies \text{hd } (\text{transpose } ps) = \text{transpose-square } (\text{hd } ps)$

⟨proof⟩

lemma *last-transpose*: $ps \neq [] \implies \text{last } (\text{transpose } ps) = \text{transpose-square } (\text{last } ps)$

⟨proof⟩

lemma *take-transpose*:

shows $\text{take } k (\text{transpose } ps) = \text{transpose } (\text{take } k ps)$

⟨proof⟩

lemma *drop-transpose*:

shows $\text{drop } k (\text{transpose } ps) = \text{transpose } (\text{drop } k ps)$

<proof>

lemma *transpose-board-correct*: $s_i \in b \iff (\text{transpose-square } s_i) \in \text{transpose-board } b$

<proof>

lemma *transpose-board*: $\text{transpose-board } (\text{board } n \ m) = \text{board } m \ n$

<proof>

shows $knights\text{-}path\ (board\ n\ m)\ (mirror2\ ps)$
<proof>

5.3 Rotate Knight's Paths

Transposing (*KnightsTour.transpose*) and mirroring (along first axis *mirror1*) a Knight's path preserves the Knight's path's property. Tranpose+Mirror1 equals a 90deg-clockwise turn.

corollary *rot90-knights-path*:

assumes *knights-path* (board *n m*) *ps*
shows *knights-path* (board *m n*) (*mirror1* (*transpose ps*))
 ⟨*proof*⟩

lemma *hd-rot90-knights-path*:

assumes *knights-path* (board *n m*) *ps* *hd ps* = (*i,j*)
shows *hd* (*mirror1* (*transpose ps*)) = (*int m+1-j,i*)
 ⟨*proof*⟩

lemma *last-rot90-knights-path*:

assumes *knights-path* (board *n m*) *ps* *last ps* = (*i,j*)
shows *last* (*mirror1* (*transpose ps*)) = (*int m+1-j,i*)
 ⟨*proof*⟩

6 Translating Paths and Boards

When constructing knight's paths for larger boards multiple knight's paths for smaller boards are concatenated. To concatenate paths the the coordinates in the path need to be translated. Therefore, simple auxiliary functions are provided.

6.1 Implementation of Path and Board Translation

Translate the coordinates for a path by (*k₁,k₂*).

fun *trans-path* :: *int* × *int* ⇒ *path* ⇒ *path* **where**
trans-path (*k₁,k₂*) [] = []
 | *trans-path* (*k₁,k₂*) ((*i,j*)#*xs*) = (*i+k₁,j+k₂*)#(*trans-path* (*k₁,k₂*) *xs*)

Translate the coordinates of a board by (*k₁,k₂*).

definition *trans-board* :: *int* × *int* ⇒ *board* ⇒ *board* **where**
trans-board *t b* ≡ (*case t of* (*k₁,k₂*) ⇒ {(*i+k₁,j+k₂*)|*i j. (i,j) ∈ b*})

6.2 Correctness of Path and Board Translation

lemma *trans-path-length*: *length ps* = *length* (*trans-path* (*k₁,k₂*) *ps*)
 ⟨*proof*⟩

lemma *trans-path-non-nil*: *ps* ≠ [] ⇒ *trans-path* (*k₁,k₂*) *ps* ≠ []
 ⟨*proof*⟩

lemma *trans-path-correct*: (*i,j*) ∈ *set ps* ⇔ (*i+k₁,j+k₂*) ∈ *set* (*trans-path* (*k₁,k₂*) *ps*)
 ⟨*proof*⟩

lemma *trans-path-non-nil-last*:

ps ≠ [] ⇒ *last* (*trans-path* (*k₁,k₂*) *ps*) = *last* (*trans-path* (*k₁,k₂*) ((*i,j*)#*ps*))
 ⟨*proof*⟩

lemma *hd-trans-path*:

assumes $ps \neq []$ $hd\ ps = (i,j)$
shows $hd\ (trans\text{-}path\ (k_1,k_2)\ ps) = (i+k_1,j+k_2)$
<proof>

lemma *last-trans-path*:

assumes $ps \neq []$ $last\ ps = (i,j)$
shows $last\ (trans\text{-}path\ (k_1,k_2)\ ps) = (i+k_1,j+k_2)$
<proof>

lemma *take-trans*:

shows $take\ k\ (trans\text{-}path\ (k_1,k_2)\ ps) = trans\text{-}path\ (k_1,k_2)\ (take\ k\ ps)$
<proof>

lemma *drop-trans*:

shows $drop\ k\ (trans\text{-}path\ (k_1,k_2)\ ps) = trans\text{-}path\ (k_1,k_2)\ (drop\ k\ ps)$
<proof>

lemma *trans-board-correct*: $(i,j) \in b \iff (i+k_1,j+k_2) \in trans\text{-}board\ (k_1,k_2)\ b$
<proof>

lemma *board-subset*: $n_1 \leq n_2 \implies m_1 \leq m_2 \implies board\ n_1\ m_1 \subseteq board\ n_2\ m_2$
<proof>

Board concatenation

corollary *board-concat*:

shows $board\ n\ m_1 \cup trans\text{-}board\ (0,int\ m_1)\ (board\ n\ m_2) = board\ n\ (m_1+m_2)$
(is $?b1 \cup ?b2 = ?b)$
<proof>

lemma *transpose-trans-board*:

$transpose\text{-}board\ (trans\text{-}board\ (k_1,k_2)\ b) = trans\text{-}board\ (k_2,k_1)\ (transpose\text{-}board\ b)$
<proof>

corollary *board-concatT*:

shows $board\ n_1\ m \cup trans\text{-}board\ (int\ n_1,0)\ (board\ n_2\ m) = board\ (n_1+n_2)\ m$ **(is**
 $?b_1 \cup ?b_2 = ?b)$
<proof>

lemma *trans-valid-step*:

$valid\text{-}step\ (i,j)\ (i',j') \implies valid\text{-}step\ (i+k_1,j+k_2)\ (i'+k_1,j'+k_2)$
<proof>

Translating a path and a boards preserves the validity.

lemma *trans-knights-path*:

assumes $knights\text{-}path\ b\ ps$
shows $knights\text{-}path\ (trans\text{-}board\ (k_1,k_2)\ b)\ (trans\text{-}path\ (k_1,k_2)\ ps)$
<proof>

Predicate that indicates if two squares s_i and s_j are adjacent in ps .

definition $step-in :: path \Rightarrow square \Rightarrow square \Rightarrow bool$ **where**

$step-in\ ps\ s_i\ s_j \equiv (\exists k. 0 < k \wedge k < length\ ps \wedge last\ (take\ k\ ps) = s_i \wedge hd\ (drop\ k\ ps) = s_j)$

lemma $step-in-Cons$: $step-in\ ps\ s_i\ s_j \implies step-in\ (s_k\#ps)\ s_i\ s_j$
 $\langle proof \rangle$

lemma $step-in-append$: $step-in\ ps\ s_i\ s_j \implies step-in\ (ps@ps')\ s_i\ s_j$
 $\langle proof \rangle$

lemma $step-in-prepend$: $step-in\ ps\ s_i\ s_j \implies step-in\ (ps'@ps)\ s_i\ s_j$
 $\langle proof \rangle$

lemma $step-in-valid-step$: $knight\text{-}path\ b\ ps \implies step-in\ ps\ s_i\ s_j \implies valid\text{-}step\ s_i\ s_j$
 $\langle proof \rangle$

lemma $trans\text{-}step\text{-}in$:

$step-in\ ps\ (i,j)\ (i',j') \implies step-in\ (trans\text{-}path\ (k_1,k_2)\ ps)\ (i+k_1,j+k_2)\ (i'+k_1,j'+k_2)$
 $\langle proof \rangle$

lemma $transpose\text{-}step\text{-}in$:

$step-in\ ps\ s_i\ s_j \implies step-in\ (transpose\ ps)\ (transpose\text{-}square\ s_i)\ (transpose\text{-}square\ s_j)$
 $(is - \implies step-in\ ?psT\ ?s_iT\ ?s_jT)$
 $\langle proof \rangle$

lemma $hd\text{-}take$: $0 < k \implies hd\ xs = hd\ (take\ k\ xs)$
 $\langle proof \rangle$

lemma $last\text{-}drop$: $k < length\ xs \implies last\ xs = last\ (drop\ k\ xs)$
 $\langle proof \rangle$

6.3 Concatenate Knight's Paths and Circuits

Concatenate two knight's path on a $n \times m$ -board along the 2nd axis if the first path contains the step $s_i \rightarrow s_j$ and there are valid steps $s_i \rightarrow hd\ ps_2'$ and $s_j \rightarrow last\ ps_2'$, where ps_2' is ps_2 is translated by m_1 . An arbitrary step in ps_2 is preserved.

corollary $knight\text{-}path\text{-}split\text{-}concat\text{-}si\text{-}prev$:

assumes $knight\text{-}path\ (board\ n\ m_1)\ ps_1\ knight\text{-}path\ (board\ n\ m_2)\ ps_2$
 $step-in\ ps_1\ s_i\ s_j\ hd\ ps_2 = (i_h,j_h)\ last\ ps_2 = (i_l,j_l)\ step-in\ ps_2\ (i,j)\ (i',j')$
 $valid\text{-}step\ s_i\ (i_h,int\ m_1+j_h)\ valid\text{-}step\ (i_l,int\ m_1+j_l)\ s_j$
shows $\exists ps. knight\text{-}path\ (board\ n\ (m_1+m_2))\ ps \wedge hd\ ps = hd\ ps_1$
 $\wedge last\ ps = last\ ps_1 \wedge step-in\ ps\ (i,int\ m_1+j)\ (i',int\ m_1+j')$
 $\langle proof \rangle$

lemma *len1-hd-last*: $\text{length } xs = 1 \implies \text{hd } xs = \text{last } xs$
 ⟨proof⟩

Weaker version of $\llbracket \text{knights-path } (\text{board } ?n \ ?m_1) \ ?ps_1; \text{knights-path } (\text{board } ?n \ ?m_2) \ ?ps_2; \text{step-in } ?ps_1 \ ?s_i \ ?s_j; \text{hd } ?ps_2 = (?i_h, ?j_h); \text{last } ?ps_2 = (?i_l, ?j_l); \text{step-in } ?ps_2 \ (?i, ?j) \ (?i', ?j'); \text{valid-step } ?s_i \ (?i_h, \text{int } ?m_1 + ?j_h); \text{valid-step } (?i_l, \text{int } ?m_1 + ?j_l) \ ?s_j \rrbracket \implies \exists ps. \text{knights-path } (\text{board } ?n \ (?m_1 + ?m_2)) \ ps \wedge \text{hd } ps = \text{hd } ?ps_1 \wedge \text{last } ps = \text{last } ?ps_1 \wedge \text{step-in } ps \ (?i, \text{int } ?m_1 + ?j) \ (?i', \text{int } ?m_1 + ?j)$.

corollary *knights-path-split-concat*:

assumes $\text{knights-path } (\text{board } n \ m_1) \ ps_1 \ \text{knights-path } (\text{board } n \ m_2) \ ps_2$
 $\text{step-in } ps_1 \ s_i \ s_j \ \text{hd } ps_2 = (i_h, j_h) \ \text{last } ps_2 = (i_l, j_l)$
 $\text{valid-step } s_i \ (i_h, \text{int } m_1 + j_h) \ \text{valid-step } (i_l, \text{int } m_1 + j_l) \ s_j$
shows $\exists ps. \text{knights-path } (\text{board } n \ (m_1 + m_2)) \ ps \wedge \text{hd } ps = \text{hd } ps_1 \wedge \text{last } ps = \text{last } ps_1$
 ⟨proof⟩

Concatenate two knight's path on a $n \times m$ -board along the 1st axis.

corollary *knights-path-split-concatT*:

assumes $\text{knights-path } (\text{board } n_1 \ m) \ ps_1 \ \text{knights-path } (\text{board } n_2 \ m) \ ps_2$
 $\text{step-in } ps_1 \ s_i \ s_j \ \text{hd } ps_2 = (i_h, j_h) \ \text{last } ps_2 = (i_l, j_l)$
 $\text{valid-step } s_i \ (\text{int } n_1 + i_h, j_h) \ \text{valid-step } (\text{int } n_1 + i_l, j_l) \ s_j$
shows $\exists ps. \text{knights-path } (\text{board } (n_1 + n_2) \ m) \ ps \wedge \text{hd } ps = \text{hd } ps_1 \wedge \text{last } ps = \text{last } ps_1$
 ⟨proof⟩

Concatenate two Knight's path along the 2nd axis. There is a valid step from the last square in the first Knight's path ps_1 to the first square in the second Knight's path ps_2 .

corollary *knights-path-concat*:

assumes $\text{knights-path } (\text{board } n \ m_1) \ ps_1 \ \text{knights-path } (\text{board } n \ m_2) \ ps_2$
 $\text{hd } ps_2 = (i_h, j_h) \ \text{valid-step } (\text{last } ps_1) \ (i_h, \text{int } m_1 + j_h)$
shows $\text{knights-path } (\text{board } n \ (m_1 + m_2)) \ (ps_1 \ @ \ (\text{trans-path } (0, \text{int } m_1) \ ps_2))$
 ⟨proof⟩

Concatenate two Knight's path along the 2nd axis. The first Knight's path end in $(2, m_1 - 1)$ (lower-right) and the second Knight's paths start in $(1, 1)$ (lower-left).

corollary *knights-path-lr-concat*:

assumes $\text{knights-path } (\text{board } n \ m_1) \ ps_1 \ \text{knights-path } (\text{board } n \ m_2) \ ps_2$
 $\text{last } ps_1 = (2, \text{int } m_1 - 1) \ \text{hd } ps_2 = (1, 1)$
shows $\text{knights-path } (\text{board } n \ (m_1 + m_2)) \ (ps_1 \ @ \ (\text{trans-path } (0, \text{int } m_1) \ ps_2))$
 ⟨proof⟩

Concatenate two Knight's circuits along the 2nd axis. In the first Knight's path the squares $(2, m_1 - 1)$ and $(4, m_1)$ are adjacent and the second Knight's circuit starts in $(1, 1)$ (lower-left) and end in $(3, 2)$.

corollary *knights-circuit-lr-concat*:

assumes *knights-circuit* (board n m_1) ps_1 *knights-circuit* (board n m_2) ps_2
 $step-in$ ps_1 (2,int m_1-1) (4,int m_1)
 hd $ps_2 = (1,1)$ $last$ $ps_2 = (3,2)$ $step-in$ ps_2 (2,int m_2-1) (4,int m_2)
shows $\exists ps.$ *knights-circuit* (board n (m_1+m_2)) $ps \wedge step-in$ ps (2,int (m_1+m_2)-1)
(4,int (m_1+m_2))
 $\langle proof \rangle$

7 Parsing Paths

In this section functions are implemented to parse and construct paths. The parser converts the matrix representation (*(nat list) list*) used in [1] to a path (*path*).

for debugging

fun *test-path* :: *path* \Rightarrow *bool* **where**
test-path ($s_i\#s_j\#xs$) = (*step-checker* s_i $s_j \wedge test-path$ ($s_j\#xs$))
| *test-path* - = *True*

fun *f-opt* :: ($'a \Rightarrow 'a$) \Rightarrow $'a$ *option* \Rightarrow $'a$ *option* **where**
f-opt - *None* = *None*
| *f-opt* f (*Some* a) = *Some* (f a)

fun *add-opt-fst-sq* :: *int* \Rightarrow *square option* \Rightarrow *square option* **where**
add-opt-fst-sq - *None* = *None*
| *add-opt-fst-sq* k (*Some* (i,j)) = *Some* ($k+i,j$)

fun *find-k-in-col* :: *nat* \Rightarrow *nat list* \Rightarrow *int option* **where**
find-k-in-col k [] = *None*
| *find-k-in-col* k ($c\#cs$) = (*if* $c = k$ *then* *Some* 1 *else* *f-opt* ((+) 1) (*find-k-in-col* k cs))

fun *find-k-sqr* :: *nat* \Rightarrow (*nat list*) *list* \Rightarrow *square option* **where**
find-k-sqr k [] = *None*
| *find-k-sqr* k ($r\#rs$) = (*case* *find-k-in-col* k r *of*
None \Rightarrow *f-opt* ($\lambda(i,j). (i+1,j)$) (*find-k-sqr* k rs)
| *Some* $j \Rightarrow$ *Some* (1, j))

Auxiliary function to easily parse pre-computed boards from paper.

fun *to-sqrs* :: *nat* \Rightarrow (*nat list*) *list* \Rightarrow *path option* **where**
to-sqrs 0 rs = *Some* []
| *to-sqrs* k rs = (*case* *find-k-sqr* k rs *of*
None \Rightarrow *None*
| *Some* $s_i \Rightarrow$ *f-opt* ($\lambda ps. ps@[s_i]$) (*to-sqrs* ($k-1$) rs))

fun *num-elems* :: (*nat list*) *list* \Rightarrow *nat* **where**
num-elems ($r\#rs$) = *length* $r * length$ ($r\#rs$)

Convert a matrix (*nat list list*) to a path (*path*). With this function we implicitly define the lower-left corner to be $(1,1)$ and the upper-right corner to be (n,m) .

definition *to-path* $rs \equiv to-sqrs (num-elems rs) (rev rs)$

Example

value *to-path*
 $[[3,22,13,16,5],$
 $[12,17,4,21,14],$
 $[23,2,15,6,9],$
 $[18,11,8,25,20],$
 $[1,24,19,10,7::nat]]$

8 Knight's Paths for $5 \times m$ -Boards

Given here are knight's paths, *kp5xmlr* and *kp5xmur*, for the $(5 \times m)$ -board that start in the lower-left corner for $m \in \{5,6,7,8,9\}$. The path *kp5xmlr* ends in the lower-right corner, whereas the path *kp5xmur* ends in the upper-right corner. The tables show the visited squares numbered in ascending order.

abbreviation *b5x5* $\equiv board\ 5\ 5$

A Knight's path for the (5×5) -board that starts in the lower-left and ends in the lower-right.

3	22	13	16	5

lemma *kp-9x7-ul: knights-path b9x7 kp9x7ul*
 ⟨proof⟩

abbreviation *b9x9* \equiv *board 9 9*

A Knight's path for the (9×9) -board that starts in the lower-left and ends in the upper-left.

lemma *kp-9x9-ul: knights-path b9x9 kp9x9ul*
 ⟨proof⟩

The following lemma is a sub-proof used in Lemma 4 in [1]. I moved the sub-proof out to a separate lemma.

lemma *knights-circuit-exists-even-n-gr10:*

assumes *even n* $n \geq 10$ $m \geq 5$

$\exists ps.$ *knights-path* (board $(n-5)$ m) $ps \wedge hd\ ps = (int\ (n-5), 1)$
 $\wedge last\ ps = (int\ (n-5)-1, int\ m-1)$

shows $\exists ps.$ *knights-circuit* (board m n) ps
 ⟨proof⟩

For every $n \times m$ -board with $min\ n\ m \geq 5$ and odd n there exists a Knight's path that starts in $(n, 1)$ (top-left) and ends in $(n-1, m-1)$ (top-right).

This lemma formalizes Lemma 4 from [1]. Formalizing the proof of this lemma was quite challenging as a lot of details on how to exactly combine the boards are left out in the original proof in [1].

lemma *knights-path-odd-n-exists:*

assumes *odd n min n m ≥ 5*

shows $\exists ps. \text{knights-path } (\text{board } n \ m) \ ps \wedge \text{hd } ps = (\text{int } n, 1) \wedge \text{last } ps = (\text{int } n-1, \text{int } m-1)$

<proof>

Auxiliary lemma that constructs a Knight's circuit if $m \geq 5$ and $n \geq 10 \wedge$ *even n*.

lemma *knights-circuit-exists-n-even-gr-10:*

assumes $n \geq 10 \wedge \text{even } n \ m \geq 5$

shows $\exists ps. \text{knights-circuit } (\text{board } n \ m) \ ps$

<proof>

Final Theorem 1: For every $n \times m$ -board with $\text{min } n \ m \geq 5$ and $n*m$ even there exists a Knight's circuit.

theorem *knights-circuit-exists:*

assumes $\text{min } n \ m \geq 5 \ \text{even } (n*m)$

shows $\exists ps. \text{knights-circuit } (\text{board } n \ m) \ ps$

<proof>

Final Theorem 2: for every $n \times m$ -board with $\text{min } n \ m \geq 5$ there exists a Knight's path.

theorem *knights-path-exists:*

assumes $\text{min } n \ m \geq 5$

shows $\exists ps. \text{knights-path } (\text{board } n \ m) \ ps$

<proof>

THE END

end
