# Minkowski's Theorem

# Manuel Eberl

### October 13, 2025

#### Abstract

Minkowski's theorem relates a subset of  $\mathbb{R}^n$ , the Lebesgue measure, and the integer lattice  $\mathbb{Z}^n$ : It states that any convex subset of  $\mathbb{R}^n$  with volume greater than  $2^n$  contains at least one lattice point from  $\mathbb{Z}^n \setminus \{0\}$ , i.e. a non-zero point with integer coefficients.

A related theorem which directly implies this is Blichfeldt's theorem, which states that any subset of  $\mathbb{R}^n$  with a volume greater than 1 contains two different points whose difference vector has integer components.

The entry contains a proof of both theorems.

### 1.3 Blichfeldt's theorem

Blichfeldt's theorem states that, given a subset of  $\mathbb{R}^n$  with n > 0 and a volume of more than 1, there exist two different points in that set whose difference vector has integer components.

This will be the key ingredient in proving Minkowski's theorem.

Note that in the HOL Light version, it is additionally required – both for Blichfeldt's theorem and for Minkowski's theorem – that the set is bounded, which we do not need.

```
proposition blichfeldt:
  fixes S :: (real ^ 'n) set
 assumes [measurable]: S \in sets \ lebesgue
 assumes emeasure lebesgue S > 1
  obtains x y where x \neq y and x \in S and y \in S and \bigwedge i. (x - y) $ i \in \mathbb{Z}
proof -
   - We define for each lattice point in \mathbb{Z}^n the corresponding cell in \mathbb{R}^n.
  define R :: int ^ 'n \Rightarrow (real ^ 'n) set
   where R = (\lambda a. \ cbox \ (of\text{-}int\text{-}vec \ a) \ (of\text{-}int\text{-}vec \ (a+1)))
  — For each lattice point, we can intersect the cell it defines with our set S to
obtain a partitioning of S.
  define T :: int ^ 'n \Rightarrow (real ^ 'n) set
   where T = (\lambda a. S \cap R a)
  — We can then translate each such partition into the cell at the origin, i.e. the
unit box R \theta.
  define T' :: int \ ^{n} \Rightarrow (real \ ^{n}) set
    where T' = (\lambda a. (\lambda x. x - of\text{-}int\text{-}vec a) \cdot T a)
  have T'-altdef: T' a = (\lambda x. \ x + of\text{-int-vec } a) - `T a \text{ for } a
