Propositional Resolution and Prime Implicates Generation

Nicolas Peltier Laboratory of Informatics of Grenoble/CNRS University Grenoble Alps

October 13, 2025

Abstract

We provide formal proofs in Isabelle-HOL (using mostly structured Isar proofs) of the soundness and completeness of the Resolution rule in propositional logic. The completeness proofs take into account the usual redundancy elimination rules (namely tautology elimination and subsumption), and several refinements of the Resolution rule are considered: ordered resolution (with selection functions), positive and negative resolution, semantic resolution and unit resolution (the latter refinement is complete only for clause sets that are Horn-renamable). We also define a concrete procedure for computing saturated sets and establish its soundness and completeness. The clause sets are not assumed to be finite, so that the results can be applied to formulas obtained by grounding sets of first-order clauses (however, a total ordering among atoms is assumed to be given).

Next, we show that the unrestricted Resolution rule is deductive-complete, in the sense that it is able to generate all (prime) implicates of any set of propositional clauses (i.e., all entailment-minimal, non-valid, clausal consequences of the considered set). The generation of prime implicates is an important problem, with many applications in artificial intelligence and verification (for abductive reasoning, knowledge compilation, diagnosis, debugging etc.). We also show that implicates can be computed in an incremental way, by fixing an ordering among all the atoms and resolving upon these atoms one by one in the considered order (with no backtracking). This feature is critical for the efficient computation of prime implicates. Building on these results, we provide a procedure for computing such implicates and establish its soundness and completeness.

Literals are defined as usual and clauses and formulas are considered as sets. Clause sets are not assumed to be finite (so that the results can be applied to sets of clauses obtained by grounding first-order clauses).

```
datatype 'a Literal = Pos 'a | Neg 'a
definition atoms = \{ x::'at. True \}
fun atom :: 'a \ Literal \Rightarrow 'a
where
  (atom (Pos A)) = A \mid
 (atom\ (Neg\ A)) = A
fun complement :: 'a Literal <math>\Rightarrow 'a Literal
where
  (complement (Pos A)) = (Neg A) \mid
  (complement (Neg A)) = (Pos A)
lemma atom-property : A = (atom \ L) \Longrightarrow (L = (Pos \ A) \lor L = (Neg \ A))
fun positive :: 'at Literal <math>\Rightarrow bool
where
 (positive (Pos A)) = True \mid
 (positive\ (Neg\ A)) = False
fun negative :: 'at Literal <math>\Rightarrow bool
where
  (negative (Pos A)) = False \mid
  (negative\ (Neg\ A)) = True
type-synonym 'a Clause = 'a Literal set
```

type-synonym 'a Formula = 'a Clause set

Note that the clauses are not assumed to be finite (some of the properties below hold for infinite clauses).

The following functions return the set of atoms occurring in a clause or formula.

```
fun atoms-clause :: 'at Clause \Rightarrow 'at set where atoms-clause C = \{A. \exists L. L \in C \land A = atom(L)\} fun atoms-formula :: 'at Formula \Rightarrow 'at set where atoms-formula S = \{A. \exists C. C \in S \land A \in atoms-clause(C)\}
```

```
lemma atoms-formula-subset: S1 \subseteq S2 \Longrightarrow atoms-formula S1 \subseteq atoms-formula
S2
\langle proof \rangle
lemma atoms-formula-union: atoms-formula (S1 \cup S2) = atoms-formula S1 \cup S2
atoms-formula S2
\langle proof \rangle
The following predicate is useful to state that every clause in a set fulfills
some property.
definition all-fulfill :: ('at Clause \Rightarrow bool) \Rightarrow 'at Formula \Rightarrow bool
  where all-fulfill P S = (\forall C. (C \in S \longrightarrow (P C)))
The order on atoms induces a (non total) order among literals:
fun literal-ordering :: 'at Literal \Rightarrow 'at Literal \Rightarrow bool
where
    (literal-ordering\ L1\ L2) = ((atom\ L1, atom\ L2) \in atom-ordering)
{f lemma}\ literal	ext{-}ordering	ext{-}trans:
 assumes literal-ordering A B
 assumes literal-ordering B C
  shows literal-ordering A C
\langle proof \rangle
definition strictly-maximal-literal :: 'at Clause <math>\Rightarrow 'at Literal \Rightarrow bool
   (strictly\text{-}maximal\text{-}literal\ S\ A) \equiv (A \in S) \land (\forall B.\ (B \in S \land A \neq B) \longrightarrow
```

2 Semantics

(literal-ordering B A))

We define the notions of interpretation, satisfiability and entailment and establish some basic properties.

```
type-synonym 'a Interpretation = 'a set
```

```
\mathbf{fun} \ \mathit{validate\text{-}literal} :: 'at \ \mathit{Interpretation} \Rightarrow 'at \ \mathit{Literal} \Rightarrow \mathit{bool} \ (\mathbf{infix} \iff \mathit{65})
  where
     (validate\text{-}literal\ I\ (Pos\ A)) = (A \in I)\ |
     (validate\text{-}literal\ I\ (Neg\ A)) = (A \notin I)
fun validate-clause :: 'at Interpretation \Rightarrow 'at Clause \Rightarrow bool (infix \iff 65)
    (validate\text{-}clause\ I\ C) = (\exists\ L.\ (L \in C) \land (validate\text{-}literal\ I\ L))
fun validate-formula :: 'at Interpretation \Rightarrow 'at Formula \Rightarrow bool (infix \iff 65)
  where
```

```
(validate\text{-}formula\ I\ S) = (\forall\ C.\ (C \in S \longrightarrow (validate\text{-}clause\ I\ C)))
\textbf{definition} \ \textit{satisfiable} :: 'at \ \textit{Formula} \Rightarrow \textit{bool}
where
  (satisfiable\ S) \equiv (\exists\ I.\ (validate\text{-}formula\ I\ S))
We define the usual notions of entailment between clauses and formulas.
definition entails :: 'at Formula \Rightarrow 'at Clause \Rightarrow bool
where
  (entails\ S\ C) \equiv (\forall\ I.\ (validate\text{-}formula\ I\ S) \longrightarrow (validate\text{-}clause\ I\ C))
lemma entails-member:
  assumes C \in S
 shows entails S C
\langle proof \rangle
definition entails-formula :: 'at Formula \Rightarrow 'at Formula \Rightarrow bool
  where (entails-formula\ S1\ S2) = (\forall\ C \in S2.\ (entails\ S1\ C))
definition equivalent :: 'at Formula \Rightarrow 'at Formula \Rightarrow bool
  where (equivalent S1 S2) = (entails-formula S1 S2 \wedge entails-formula S2 S1)
lemma equivalent-symmetric: equivalent S1 S2 \Longrightarrow equivalent S2 S1
\langle proof \rangle
lemma entailment-implies-validity:

 assumes equivalent S1 S2
 assumes equivalent S2 S3
  shows equivalent S1 S3
\langle proof \rangle
```

 \mathbf{lemma} entailment-subset:

```
assumes S2 \subseteq S1

shows entails-formula S1 S2

\langle proof \rangle

lemma entailed-formula-entails-implicates:

assumes entails-formula S1 S2

assumes entails S2 C

shows entails S1 C

\langle proof \rangle
```

3 Inference Rules

```
We first define an abstract notion of a binary inference rule.
```

```
type-synonym 'a BinaryRule = 'a Clause \Rightarrow 'a Clause \Rightarrow 'a Clause \Rightarrow bool
```

```
definition less-restrictive :: 'at BinaryRule \Rightarrow 'at BinaryRule \Rightarrow bool where
```

```
(less-restrictive R1 R2) = (\forall P1 P2 C. (R2 P1 P2 C) \longrightarrow ((R1 P1 P2 C) \lor (R1 P2 P1 C)))
```

The following functions allow to generate all the clauses that are deducible from a given clause set (in one step).

```
fun all-deducible-clauses:: 'at BinaryRule \Rightarrow 'at Formula \Rightarrow 'at Formula where all-deducible-clauses R S = \{ C. \exists P1 \ P2. \ P1 \in S \land P2 \in S \land (R \ P1 \ P2 \ C) \}
```

fun add-all-deducible-clauses:: 'at $BinaryRule \Rightarrow$ 'at $Formula \Rightarrow$

```
definition derived-clauses-are-finite :: 'at BinaryRule \Rightarrow bool where derived-clauses-are-finite R = (\forall P1 \ P2 \ C. \ (finite \ P1 \longrightarrow finite \ P2 \longrightarrow (R \ P1 \ P2 \ C) \longrightarrow finite \ C))
```

```
lemma less-restrictive-and-finite:
assumes less-restrictive R1 R2
assumes derived-clauses-are-finite R1
shows derived-clauses-are-finite R2
⟨proof⟩
```

We then define the unrestricted resolution rule and usual resolution refinements.

3.1 Unrestricted Resolution

```
definition resolvent :: 'at BinaryRule where (resolvent P1 P2 C) \equiv
```

```
(\exists A. ((Pos \ A) \in P1 \land (Neg \ A) \in P2 \land (C = (P1 - \{Pos \ A\}) \cup (P2 - \{Neg \ A\})))))
```

For technical convience, we now introduce a slightly extended definition in which resolution upon a literal not occurring in the premises is allowed (the obtained resolvent is then redundant with the premises). If the atom is fixed then this version of the resolution rule can be turned into a total function.

```
fun resolvent-upon :: 'at Clause \Rightarrow 'at Clause \Rightarrow 'at Clause where

(resolvent-upon\ P1\ P2\ A) = \\ (P1-\{Pos\ A\}) \cup (P2-\{Neg\ A\}))
lemma resolvent-upon-is-resolvent :
assumes Pos\ A\in P1
assumes Neg\ A\in P2
shows resolvent P1\ P2\ (resolvent-upon\ P1\ P2\ A)
\langle proof \rangle
lemma resolvent-is-resolvent-upon P1\ P2\ A
\langle proof \rangle
lemma resolvent-is-finite :
shows \exists A.\ C=resolvent-is-finite :
shows derived-clauses-are-finite\ resolvent
\langle proof \rangle
```

In the next subsections we introduce various resolution refinements and show that they are more restrictive than unrestricted resolution.

3.2 Ordered Resolution

In the first refinement, resolution is only allowed on maximal literals.

```
definition ordered-resolvent :: 'at Clause \Rightarrow 'at Clause \Rightarrow 'at Clause \Rightarrow bool where (ordered-resolvent P1 P2 C) \equiv (\exists A. ((C = ( (P1 - { Pos A}) \cup ( P2 - { Neg A })))) \land (strictly-maximal-literal P1 (Pos A)) \land (strictly-maximal-literal P2 (Neg A))))
```

We now show that the maximal literal of the resolvent is always smaller than those of the premises.

```
 \begin{array}{l} \textbf{lemma} \ resolution\text{-}and\text{-}max\text{-}literal :} \\ \textbf{assumes} \ R = resolvent\text{-}upon \ P1 \ P2 \ A \\ \textbf{assumes} \ strictly\text{-}maximal\text{-}literal \ P1 \ (Pos \ A) \\ \textbf{assumes} \ strictly\text{-}maximal\text{-}literal \ P2 \ (Neg \ A) \\ \textbf{assumes} \ strictly\text{-}maximal\text{-}literal \ R \ M \\ \end{array}
```

```
shows (atom\ M,\ A) \in atom\text{-}ordering \langle proof \rangle
```

3.3 Ordered Resolution with Selection

In the next restriction strategy, some negative literals are selected with highest priority for applying the resolution rule, regardless of the ordering. Relaxed ordering restrictions also apply.

```
\textbf{definition} \ (\textit{selected-part Sel C}) = \{ \ \textit{L. L} \in \textit{C} \land (\exists \textit{A} \in \textit{Sel. L} = (\textit{Neg A})) \ \}
```

definition ordered-sel-resolvent :: 'at set \Rightarrow 'at Clause \Rightarrow 'at Clause \Rightarrow 'at Clause \Rightarrow bool

where

```
 \begin{array}{l} (ordered\text{-}sel\text{-}resolvent\ Sel\ P1\ P2\ C) \equiv \\ (\exists\,A.\ ((C=(\ P1-\{\ Pos\ A\})\cup(\ P2-\{\ Neg\ A\ \}))) \\ \land (strictly\text{-}maximal\text{-}literal\ P1\ (Pos\ A)) \land ((selected\text{-}part\ Sel\ P1)=\{\}) \land \\ (\ ((strictly\text{-}maximal\text{-}literal\ P2\ (Neg\ A)) \land (selected\text{-}part\ Sel\ P2)=\{\}) \\ \lor (strictly\text{-}maximal\text{-}literal\ (selected\text{-}part\ Sel\ P2)\ (Neg\ A))))) \\ \end{array}
```

 $\mathbf{lemma} \ ordered\text{-}resolvent\text{-}is\text{-}resolvent : less\text{-}restrictive \ resolvent \ ordered\text{-}resolvent} \\ \langle proof \rangle$

The next lemma states that ordered resolution with selection coincides with ordered resolution if the selected part is empty.

```
lemma ordered-sel-resolvent-is-ordered-resolvent:
assumes ordered-resolvent P1 P2 C
assumes selected-part Sel P1 = {}
assumes selected-part Sel P2 = {}
shows ordered-sel-resolvent Sel P1 P2 C
⟨proof⟩
lemma ordered-resolvent-upon-is-resolvent:
assumes strictly-maximal-literal P1 (Pos A)
assumes strictly-maximal-literal P2 (Neg A)
shows ordered-resolvent P1 P2 (resolvent-upon P1 P2 A)
⟨proof⟩
```

3.4 Semantic Resolution

In this strategy, resolution is applied only if one parent is false in some (fixed) interpretation. Note that ordering restrictions still apply, although they are relaxed.

```
definition validated-part :: 'at set \Rightarrow 'at Clause \Rightarrow 'at Clause where (validated-part I C) = { L. L \in C \land (validate-literal \ I \ L) } definition ordered-model-resolvent :: 'at Interpretation \Rightarrow 'at Clause \Rightarrow 'at Clause \Rightarrow 'at Clause \Rightarrow bool
```

```
where
```

```
(ordered-model-resolvent I P1 P2 C) =  (\exists L. \ (C = (P1 - \{ L \} \cup (P2 - \{ complement L \}))) \land \\ ((validated-part I P1) = \{ \} \land (strictly-maximal-literal P1 L)) \\ \land (strictly-maximal-literal \ (validated-part I P2) \ (complement L)))
```

 $\begin{array}{l} \textbf{lemma} \ ordered\text{-}model\text{-}resolvent\text{-}is\text{-}resolvent: less\text{-}restrictive resolvent (ordered\text{-}model\text{-}resolvent I)} \\ \langle proof \rangle \end{array}$

3.5 Unit Resolution

Resolution is applied only if one parent is unit (this restriction is incomplete).

```
definition Unit :: 'at \ Clause \Rightarrow bool

where (Unit \ C) = ((card \ C) = 1)

definition unit-resolvent :: 'at \ BinaryRule

where (unit-resolvent P1 \ P2 \ C) = ((\exists L. \ (C = (\ (P1 - \{\ L\}) \cup (\ P2 - \{\ complement \ L\ \})))

\land L \in P1 \land (complement \ L) \in P2) \land Unit \ P1)
```

lemma unit-resolvent-is-resolvent : less-restrictive resolvent unit-resolvent $\langle proof \rangle$

3.6 Positive and Negative Resolution

Resolution is applied only if one parent is positive (resp. negative). Again, relaxed ordering restrictions apply.

```
definition positive-part :: 'at Clause \Rightarrow 'at Clause
where
  (positive-part\ C) = \{\ L.\ (\exists\ A.\ L = Pos\ A) \land L \in C\ \}
definition negative-part :: 'at Clause <math>\Rightarrow 'at Clause
where
  (negative-part\ C) = \{\ L.\ (\exists\ A.\ L = Neg\ A) \land L \in C\ \}
lemma decomposition-clause-pos-neg:
  C = (negative-part \ C) \cup (positive-part \ C)
\langle proof \rangle
definition ordered-positive-resolvent :: 'at Clause \Rightarrow 'at Clause \Rightarrow 'at Clause
bool
where
  (ordered\text{-}positive\text{-}resolvent\ P1\ P2\ C) =
    (\exists L. (C = (P1 - \{L\} \cup (P2 - \{complement L\}))) \land
      ((negative-part\ P1) = \{\} \land (strictly-maximal-literal\ P1\ L))
      \land (strictly\text{-}maximal\text{-}literal (negative\text{-}part P2) (complement L)))
```

```
definition ordered-negative-resolvent :: 'at Clause \Rightarrow 'at Clause \Rightarrow 'at Clause \Rightarrow bool where (ordered-negative-resolvent P1 P2 C) = (\exists L. (C = (P1 - \{L\} \cup (P2 - \{complement L\}))) \land ((positive-part P1) = \{\} \land (strictly-maximal-literal P1 L)) \land (strictly-maximal-literal (positive-part P2) (complement L)))
```

 $\textbf{lemma} \ positive\text{-}resolvent\text{-}is\text{-}resolvent: less\text{-}restrictive} \ resolvent \ ordered\text{-}positive\text{-}resolvent \\ \langle proof \rangle$

 $\mathbf{lemma}\ negative\text{-}resolvent\text{-}is\text{-}resolvent: less\text{-}restrictive\ resolvent\ ordered\text{-}negative\text{-}resolvent\ } \\ \langle proof \rangle$

4 Redundancy Elimination Rules

```
We define the usual redundancy elimination rules.
```

```
definition tautology :: 'a Clause \Rightarrow bool
where
  (tautology\ C) \equiv (\exists\ A.\ (Pos\ A \in C \land Neg\ A \in C))
definition subsumes :: 'a Clause \Rightarrow 'a Clause \Rightarrow bool
where
  (subsumes\ C\ D)\ \equiv (C\subset D)
definition redundant :: 'a Clause \Rightarrow 'a Formula \Rightarrow bool
  redundant C S = ((tautology C) \lor (\exists D. (D \in S \land subsumes D C)))
definition strictly-redundant :: 'a Clause \Rightarrow 'a Formula \Rightarrow bool
  strictly-redundant C S = ((tautology \ C) \lor (\exists D. (D \in S \land (D \subset C))))
definition simplify :: 'at Formula \Rightarrow 'at Formula
  simplify S = \{ C. C \in S \land \neg strictly\text{-redundant } CS \}
We first establish some basic syntactic properties.
lemma tautology-monotonous: (tautology C) \Longrightarrow (C \subseteq D) \Longrightarrow (tautology D)
\langle proof \rangle
lemma simplify-involutive:
  shows simplify (simplify S) = (simplify S)
\langle proof \rangle
lemma simplify-finite:
  assumes all-fulfill finite S
 shows all-fulfill finite (simplify S)
```

```
\langle proof \rangle
lemma atoms-formula-simplify:
 shows atoms-formula (simplify S) \subseteq atoms-formula S
\langle proof \rangle
{\bf lemma}\ subsumption\text{-}preserves\text{-}redundancy:
  assumes redundant C S
 assumes subsumes \ C \ D
 shows redundant D S
\langle proof \rangle
\mathbf{lemma}\ subsumption\text{-}and\text{-}max\text{-}literal:
  assumes subsumes C1 C2
 assumes strictly-maximal-literal C1 L1
 assumes strictly-maximal-literal C2 L2
  assumes A1 = atom L1
 assumes A2 = atom L2
 shows (A1 = A2) \lor (A1,A2) \in atom\text{-}ordering
\langle proof \rangle
{\bf lemma}\ superset\text{-}preserves\text{-}redundancy\text{:}
  assumes redundant C S
 assumes S \subseteq S'
  shows redundant\ C\ S'
\langle proof \rangle
lemma superset-preserves-strict-redundancy:
  assumes strictly-redundant C S
 assumes S \subseteq SS
 {\bf shows}\ strictly\text{-}redundant\ C\ SS
\langle proof \rangle
The following lemmas relate the above notions with that of semantic entail-
ment and thus establish the soundness of redundancy elimination rules.
\mathbf{lemma}\ tautologies	ext{-}are	ext{-}valid:
  assumes tautology C
 {\bf shows}\ validate\text{-}clause\ I\ C
\langle proof \rangle
\mathbf{lemma}\ \mathit{subsumption}\text{-}\mathit{and}\text{-}\mathit{semantics}:
 assumes subsumes \ C \ D
 assumes validate-clause I C
 shows validate-clause I D
\langle proof \rangle
{f lemma}\ redundancy-and-semantics:
  assumes redundant C S
  assumes validate-formula IS
```

```
shows validate-clause I C
\langle proof \rangle
lemma redundancy-implies-entailment:
 assumes redundant C S
  shows entails S C
\langle proof \rangle
lemma simplify-and-membership:
  assumes all-fulfill finite S
 \mathbf{assumes}\ T = \mathit{simplify}\ S
 assumes C \in S
 shows redundant C T
\langle proof \rangle
lemma simplify-preserves-redundancy:
  assumes all-fulfill finite S
 assumes redundant C S
 shows redundant C (simplify S)
\langle proof \rangle
{\bf lemma}\ simplify-preserves\text{-}strict\text{-}redundancy\text{:}
  assumes all-fulfill finite S
 assumes strictly-redundant C S
  \mathbf{shows}\ strictly\text{-}redundant\ C\ (simplify\ S)
\langle proof \rangle
{\bf lemma}\ simplify \hbox{-} preserves \hbox{-} semantic:
  assumes T = simplify S
 assumes all-fulfill finite S
 shows validate-formula I S \longleftrightarrow validate-formula I T
{\bf lemma}\ simplify \hbox{-} preserves \hbox{-} equivalence:
 assumes T = simplify S
 assumes all-fulfill finite S
  shows equivalent S T
\langle proof \rangle
After simplification, the formula contains no strictly redundant clause:
definition non\text{-}redundant :: 'at Formula <math>\Rightarrow bool
  where non-redundant S = (\forall C. (C \in S \longrightarrow \neg strictly - redundant C S))
\mathbf{lemma}\ simplify\text{-}non\text{-}redundant:
 shows non-redundant (simplify S)
\langle proof \rangle
lemma deducible-clause-preserve-redundancy:
  assumes redundant \ C \ S
```

```
shows redundant C (add-all-deducible-clauses R S) \langle proof \rangle
```

5 Renaming

A renaming is a function changing the sign of some literals. We show that this operation preserves most of the previous syntactic and semantic notions.

```
definition rename-literal :: 'at set \Rightarrow 'at Literal \Rightarrow 'at Literal
where rename-literal A L = (if ((atom L) \in A) then (complement L) else L)
definition rename-clause :: 'at set \Rightarrow 'at Clause \Rightarrow 'at Clause
where rename-clause A C = \{L. \exists LL. LL \in C \land L = (rename-literal A LL)\}
definition rename-formula :: 'at set \Rightarrow 'at Formula \Rightarrow 'at Formula
where rename-formula A S = \{C. \exists CC. CC \in S \land C = (rename-clause A CC)\}\
lemma inverse-renaming: (rename-literal\ A\ (rename-literal\ A\ L)) = L
\langle proof \rangle
lemma inverse-clause-renaming: (rename-clause\ A\ (rename-clause\ A\ L)) = L

 assumes rename-literal A L1 = rename-literal A L2
 shows L1 = L2
\langle proof \rangle
lemma renaming-preserves-strictly-maximal-literal:
 assumes strictly-maximal-literal CL
 shows strictly-maximal-literal (rename-clause A C) (rename-literal A L)
\langle proof \rangle
```

```
lemma renaming-and-selected-part:
   selected-part UNIV\ C = rename-clause Sel\ (validated-part Sel\ (rename-clause 
C))
\langle proof \rangle
\mathbf{lemma}\ renaming\text{-}preserves\text{-}tautology:
    assumes tautology C
    shows tautology (rename-clause Sel C)
\langle proof \rangle
lemma rename-union : rename-clause Sel (C \cup D) = rename-clause Sel C \cup D
rename-clause Sel D
\langle proof \rangle
lemma renaming-set-minus-subset:
    rename-clause Sel\ (C - \{L\}) \subseteq rename-clause Sel\ C - \{rename-literal Sel\ L\}
\langle proof \rangle
lemma renaming-set-minus : rename-clause Sel(C - \{L\})
    = (rename-clause\ Sel\ C) - \{rename-literal\ Sel\ L\ \}
\langle proof \rangle
definition rename-interpretation :: 'at set \Rightarrow 'at Interpretation \Rightarrow 'at Interpreta-
tion
where
     rename-interpretation Sel I = \{ A. (A \in I \land A \notin Sel) \} \cup \{ A. (A \notin I \land A \in I) \}
{\bf lemma}\ renaming\text{-}preserves\text{-}semantic:
    assumes validate-literal IL
    shows validate-literal (rename-interpretation Sel I) (rename-literal Sel L)
\langle proof \rangle
lemma renaming-preserves-satisfiability:
    assumes satisfiable S
    shows satisfiable (rename-formula Sel S)
\langle proof \rangle
lemma renaming-preserves-subsumption:
    assumes subsumes \ C \ D
    shows subsumes (rename-clause Sel C) (rename-clause Sel D)
\langle proof \rangle
```

6 Soundness

In this section we prove that all the rules introduced in the previous section are sound. We first introduce an abstract notion of soundness.

```
definition Sound :: 'at BinaryRule \Rightarrow bool
where
  (Sound\ Rule) \equiv \forall I\ P1\ P2\ C.\ (Rule\ P1\ P2\ C \longrightarrow (validate-clause\ I\ P1) \longrightarrow
(validate-clause I P2)
    \longrightarrow (validate-clause I(C))
\mathbf{lemma}\ soundness\text{-} and\text{-} entailment:
  assumes Sound Rule
 assumes Rule P1 P2 C
 assumes P1 \in S
 assumes P2 \in S
 shows entails S C
\langle proof \rangle
lemma all-deducible-sound:
  assumes Sound R
 shows entails-formula S (all-deducible-clauses R S)
\langle proof \rangle
\mathbf{lemma}\ add\text{-}all\text{-}deducible\text{-}sound:
 assumes Sound R
  shows entails-formula S (add-all-deducible-clauses R S)
\langle proof \rangle
If a rule is more restrictive than a sound rule then it is necessarily sound.
lemma less-restrictive-correct:
  assumes less-restrictive R1 R2
 assumes Sound R1
 shows Sound R2
\langle proof \rangle
We finally establish usual concrete soundness results.
theorem resolution-is-correct:
  (Sound resolvent)
\langle proof \rangle
{\bf theorem}\ {\it ordered-resolution-correct}: Sound\ {\it ordered-resolvent}
\langle proof \rangle
theorem ordered-model-resolution-correct: Sound (ordered-model-resolvent I)
\langle proof \rangle
{\bf theorem}\ ordered\hbox{-}positive\hbox{-}resolution\hbox{-}correct: Sound\ ordered\hbox{-}positive\hbox{-}resolvent
\langle proof \rangle
{\bf theorem}\ ordered\text{-}negative\text{-}resolution\text{-}correct: Sound\ ordered\text{-}negative\text{-}resolvent
\langle proof \rangle
{\bf theorem}\ {\it unit-resolvent-correct}: Sound\ {\it unit-resolvent}
```

 $\langle proof \rangle$

7 Refutational Completeness

In this section we establish the refutational completeness of the previous inference rules (under adequate restrictions for the unit resolution rule). Completeness is proven w.r.t. redundancy elimination rules, i.e., we show that every saturated unsatisfiable clause set contains the empty clause.

We first introduce an abstract notion of saturation.

If a set of clauses is saturated under some rule then it is necessarily saturated under more restrictive rules, which entails that if a rule is less restrictive than a complete rule then it is also complete.

```
lemma less-restrictive-saturated:
assumes less-restrictive R1 R2
assumes saturated-binary-rule R1 S
shows saturated-binary-rule R2 S
⟨proof⟩

lemma less-restrictive-complete:
assumes less-restrictive R1 R2
assumes Complete R2
shows Complete R1
⟨proof⟩
```

7.1 Ordered Resolution

We define a function associating every set of clauses S with a "canonic" interpretation constructed from S. If S is saturated under ordered resolution and does not contain the empty clause then the interpretation is a model of S. The interpretation is defined by mean of an auxiliary function that maps every atom to a function indicating whether the atom occurs in the interpretation corresponding to a given clause set. The auxiliary function is defined by induction on the set of atoms.

function canonic-int-fun-ordered :: 'at \Rightarrow ('at Formula \Rightarrow bool)

```
where
  (canonic\text{-}int\text{-}fun\text{-}ordered\ A) =
      (\lambda S. (\exists C. (C \in S) \land (strictly\text{-}maximal\text{-}literal C (Pos A)))
    \land (\forall B. (Pos B \in C \longrightarrow (B, A) \in atom\text{-}ordering \longrightarrow (\neg(canonic\text{-}int\text{-}fun\text{-}ordered))
    \land (\forall B. (Neg B \in C \longrightarrow (B, A) \in atom\text{-}ordering \longrightarrow ((canonic\text{-}int\text{-}fun\text{-}ordered))
B(S))))))
\langle proof \rangle
termination \langle proof \rangle
\textbf{definition} \ \ \textit{canonic-int-ordered} \ :: \ 'at \ \ \textit{Formula} \ \Rightarrow \ 'at \ \ \textit{Interpretation}
  (canonic\text{-}int\text{-}ordered\ S) = \{A.\ ((canonic\text{-}int\text{-}fun\text{-}ordered\ A)\ S)\}
We first prove that the canonic interpretation validates every clause having
a positive strictly maximal literal
{f lemma}\ int	ext{-}validate	ext{-}cl	ext{-}with	ext{-}pos	ext{-}max :
  assumes strictly-maximal-literal C (Pos A)
  assumes C \in S
  shows validate-clause (canonic-int-ordered S) C
\langle proof \rangle
{f lemma}\ strictly-maximal-literal-exists:
  \forall C. (((finite \ C) \land (card \ C) = n \land n \neq 0 \land (\neg (tautology \ C))))
    \longrightarrow (\exists A. (strictly-maximal-literal \ C \ A)) (is ?P \ n)
\langle proof \rangle
We then deduce that all clauses are validated.
lemma canonic-int-validates-all-clauses:
  assumes saturated-binary-rule ordered-resolvent S
  assumes all-fulfill finite S
  assumes \{\} \notin S
  assumes C \in S
  shows validate-clause (canonic-int-ordered S) C
\langle proof \rangle
theorem ordered-resolution-is-complete:
  Complete ordered-resolvent
\langle proof \rangle
```

7.2 Ordered Resolution with Selection

We now consider the case where some negative literals are considered with highest priority. The proof reuses the canonic interpretation defined in the previous section. The interpretation is constructed using only clauses with no selected literals. By the previous result, all such clauses must be satisfied. We then show that the property carries over to the clauses with non empty selected part.

```
definition empty-selected-part Sel S = \{ C. C \in S \land (selected\text{-part Sel } C) = \{ \} \}
\mathbf{lemma}\ saturated\text{-}ordered\text{-}sel\text{-}res\text{-}empty\text{-}sel\ :
  assumes saturated-binary-rule (ordered-sel-resolvent Sel) S
  shows saturated-binary-rule ordered-resolvent (empty-selected-part Sel S)
\langle proof \rangle
definition ordered-sel-resolvent-upon :: 'at set \Rightarrow 'at Clause \Rightarrow 'at Clause \Rightarrow 'at
Clause \Rightarrow 'at \Rightarrow bool
  where
  ordered-sel-resolvent-upon Sel P1 P2 C A \equiv
   (((C = (P1 - \{Pos A\}) \cup (P2 - \{Neg A\})))
     \land (strictly-maximal-literal P1 (Pos A)) \land ((selected-part Sel P1) = {})
     \land ( ((strictly-maximal-literal P2 (Neg A)) \land (selected-part Sel P2) = {})
        \vee (strictly-maximal-literal (selected-part Sel P2) (Neg A)))))
{\bf lemma} \ ordered\text{-}sel\text{-}resolvent\text{-}upon\text{-}is\text{-}resolvent\text{:}
  assumes ordered-sel-resolvent-upon Sel P1 P2 C A
  shows ordered-sel-resolvent Sel P1 P2 C
\langle proof \rangle
lemma resolution-decreases-selected-part:
 assumes ordered-sel-resolvent-upon Sel P1 P2 C A
  assumes Neg A \in P2
 assumes finite P1
  assumes finite P2
  assumes card (selected-part Sel P2) = Suc n
  shows card (selected-part Sel C) = n
\langle proof \rangle
{f lemma}\ canonic\ -int\ -validates\ -all\ -clauses\ -sel:
  assumes saturated-binary-rule (ordered-sel-resolvent Sel) S
 assumes all-fulfill finite S
 assumes \{\} \notin S
  assumes C \in S
  shows validate-clause (canonic-int-ordered (empty-selected-part Sel S)) C
\langle proof \rangle
theorem ordered-resolution-is-complete-ordered-sel:
  Complete (ordered-sel-resolvent Sel)
\langle proof \rangle
```

7.3 Semantic Resolution

We show that under some particular renaming, model resolution simulates ordered resolution where all negative literals are selected, which immediately entails the refutational completeness of model resolution.

7.4 Positive and Negative Resolution

We show that positive and negative resolution simulate model resolution with some specific interpretation. Then completeness follows from previous results.

```
{\bf lemma}\ empty-interpretation-validate:
  validate-literal \{\}\ L = (\exists A.\ (L = Neg\ A))
\langle proof \rangle
{\bf lemma}\ universal \hbox{-} interpretation \hbox{-} validate:
  validate-literal UNIV L = (\exists A. (L = Pos A))
\langle proof \rangle
lemma negative-part-lemma:
  (negative-part\ C) = (validated-part\ \{\}\ C)
\langle proof \rangle
lemma positive-part-lemma:
  (positive-part\ C) = (validated-part\ UNIV\ C)
\langle proof \rangle
lemma negative-resolvent-is-model-res:
  less-restrictive ordered-negative-resolvent (ordered-model-resolvent UNIV)
\langle proof \rangle
lemma positive-resolvent-is-model-res:
  less-restrictive ordered-positive-resolvent (ordered-model-resolvent {})
\langle proof \rangle
theorem ordered-positive-resolvent-is-complete: Complete ordered-positive-resolvent
\langle proof \rangle
```

 ${\bf theorem}\ ordered-negative-resolvent-is-complete:\ Complete\ ordered-negative-resolvent$

 $\langle proof \rangle$

7.5 Unit Resolution and Horn Renamable Clauses

Unit resolution is complete if the considered clause set can be transformed into a Horn clause set by renaming. This result is proven by showing that unit resolution simulates semantic resolution for Horn-renamable clauses (for some specific interpretation).

```
definition Horn: 'at\ Clause \Rightarrow bool where (Horn\ C) = ((card\ (positive-part\ C)) \leq 1) definition Horn-renamable-formula: 'at\ Formula \Rightarrow bool where Horn-renamable-formula S = (\exists\ I.\ (all-fulfill\ Horn\ (rename-formula\ I\ S))) theorem unit-resolvent-complete-for-Horn-renamable-set: assumes saturated-binary-rule unit-resolvent S assumes all-fulfill finite S assumes \{\} \notin S assumes Horn-renamable-formula S shows satisfiable\ S (proof)
```

8 Computation of Saturated Clause Sets

We now provide a concrete (rather straightforward) procedure for computing saturated clause sets. Starting from the initial set, we define a sequence of clause sets, where each set is obtained from the previous one by applying the resolution rule in a systematic way, followed by redundancy elimination rules. The algorithm is generic, in the sense that it applies to any binary inference rule.

```
fun inferred-clause-sets :: 'at BinaryRule \Rightarrow 'at Formula \Rightarrow nat \Rightarrow 'at Formula where

(inferred-clause-sets R S 0) = (simplify S) |

(inferred-clause-sets R S (Suc N)) =

(simplify (add-all-deducible-clauses R (inferred-clause-sets R S N)))
```

The saturated set is constructed by considering the set of persistent clauses, i.e., the clauses that are generated and never deleted.

```
fun saturation :: 'at BinaryRule \Rightarrow 'at Formula \Rightarrow 'at Formula where saturation R S = \{ C. \exists N. (\forall M. (M \geq N \longrightarrow C \in inferred\text{-}clause\text{-}sets R S M)) \}
```

We prove that all inference rules yield finite clauses.

theorem ordered-resolvent-is-finite : derived-clauses-are-finite ordered-resolvent $\langle proof \rangle$

```
\textbf{theorem}\ \textit{model-resolvent-is-finite}: \textit{derived-clauses-are-finite}\ (\textit{ordered-model-resolvent-is-finite})
\langle proof \rangle
{\bf theorem}\ positive-resolvent-is-finite: derived-clauses-are-finite\ ordered-positive-resolvent
\langle proof \rangle
{\bf theorem}\ negative-resolvent\text{-}is\text{-}finite: derived\text{-}clauses\text{-}are\text{-}finite\ ordered\text{-}negative-resolvent
\langle proof \rangle
{\bf theorem}\ {\it unit-resolvent-is-finite}: {\it derived-clauses-are-finite}\ {\it unit-resolvent}
\langle proof \rangle
\mathbf{lemma}\ \mathit{all-deducible-clauses-are-finite}:
  assumes derived-clauses-are-finite R
 assumes all-fulfill finite S
  shows all-fulfill finite (all-deducible-clauses R S)
\langle proof \rangle
This entails that all the clauses occurring in the sets in the sequence are
\mathbf{lemma} \ \mathit{all-inferred-clause-sets-are-finite}:
  assumes derived-clauses-are-finite R
 assumes all-fulfill finite S
  shows all-fulfill finite (inferred-clause-sets R S N)
\langle proof \rangle
lemma add-all-deducible-clauses-finite:
  assumes derived-clauses-are-finite R
 assumes all-fulfill finite S
  shows all-fulfill finite (add-all-deducible-clauses R (inferred-clause-sets R S N))
\langle proof \rangle
We show that the set of redundant clauses can only increase.
\mathbf{lemma}\ sequence \textit{-of-inferred-clause-sets-is-monotonous}:
 assumes derived-clauses-are-finite R
 assumes all-fulfill finite S
 shows \forall C. redundant C (inferred-clause-sets R S N)
  \longrightarrow redundant C (inferred-clause-sets R S (N+M::nat))
\langle proof \rangle
We show that non-persistent clauses are strictly redundant in some element
of the sequence.
{f lemma} non-persistent-clauses-are-redundant:
  assumes D \in inferred-clause-sets R S N
 assumes D \notin saturation R S
 assumes all-fulfill finite S
```

```
assumes derived-clauses-are-finite R
 shows \exists M. strictly-redundant D (inferred-clause-sets R S M)
\langle proof \rangle
This entails that the clauses that are redundant in some set in the sequence
are also redundant in the set of persistent clauses.
{\bf lemma}\ persistent\text{-}clauses\text{-}subsume\text{-}redundant\text{-}clauses:
 assumes redundant \ C \ (inferred-clause-sets R \ S \ N)
 assumes all-fulfill finite S
 assumes derived-clauses-are-finite R
 assumes finite C
 shows redundant C (saturation R S)
\langle proof \rangle
We deduce that the set of persistent clauses is saturated.
{\bf theorem}\ persistent\text{-}clauses\text{-}are\text{-}saturated:
assumes derived-clauses-are-finite R
assumes all-fulfill finite S
 shows saturated-binary-rule R (saturation R S)
Finally, we show that the computed saturated set is equivalent to the initial
formula.
theorem saturation-is-correct:
 assumes Sound R
 assumes derived-clauses-are-finite R
 assumes all-fulfill finite S
 shows equivalent S (saturation R S)
\langle proof \rangle
```

9 Prime Implicates Generation

We show that the unrestricted resolution rule is deductive complete, i.e. that it is able to generate all (prime) implicates of any given clause set.

9.1 Implicates and Prime Implicates

We first introduce the definitions of implicates and prime implicates.

```
definition implicates :: 'at \ Formula \Rightarrow 'at \ Formula where implicates \ S = \{ \ C. \ entails \ S \ C \ \}
definition prime-implicates :: 'at \ Formula \Rightarrow 'at \ Formula where prime-implicates \ S = simplify \ (implicates \ S)
```

9.2 Generation of Prime Implicates

We introduce a function simplifying a given clause set by evaluating some literals to false. We show that this partial evaluation operation preserves saturatedness and that if the considered set of literals is an implicate of the initial clause set then the partial evaluation yields a clause set that is unsatisfiable. Then the proof follows from refutational completeness: since the partially evaluated set is unsatisfiable and saturated it must contain the empty clause, and therefore the initial clause set necessarily contains a clause subsuming the implicate.

```
fun partial-evaluation :: 'a Formula \Rightarrow 'a Literal set \Rightarrow 'a Formula
where
  (partial-evaluation\ S\ C) = \{E.\ \exists\ D.\ D\in S\ \land\ E = D-C\ \land\ \neg(\exists\ L.\ (L\in C)\ \land\ )\}
(complement L) \in D)

 assumes non-redundant S
 shows S = prime-implicates S
\langle proof \rangle
```

9.3 Incremental Prime Implicates Computation

We show that it is possible to compute the set of prime implicates incrementally i.e., to fix an ordering among atoms, and to compute the set of resolvents upon each atom one by one, without backtracking (in the sense that if the resolvents upon a given atom are generated at some step i then no resolvents upon the same atom are generated at step i < j. This feature is critical in practice for the efficiency of prime implicates generation algorithms.

We first introduce a function computing all resolvents upon a given atom.

```
definition all-resolvents-upon :: 'at Formula \Rightarrow 'at \Rightarrow 'at Formula where (all-resolvents-upon S(A) = \{ (C, \exists P1 \ P2, P1 \in S \land P2 \in S \land C = (resolvent-upon \ P1 \ P2 \ A) \}

lemma resolvent-upon-correct:
assumes P1 \in S
assumes P2 \in S
assumes P2 \in S
assumes P2 \in S
assumes P3 \in S
```

```
\langle proof \rangle
```

```
lemma atoms-formula-resolvents: shows atoms-formula (all-resolvents-upon SA) \subseteq atoms-formula S \land proof \land
```

We define a partial saturation predicate that is restricted to a specific atom.

```
definition partial-saturation :: 'at Formula \Rightarrow 'at \Rightarrow 'at Formula \Rightarrow bool where
```

```
(partial\text{-}saturation\ S\ A\ R) = (\forall\ P1\ P2.\ (P1\in S\longrightarrow P2\in S\longrightarrow (redundant\ (resolvent\text{-}upon\ P1\ P2\ A)\ R)))
```

We show that the resolvent of two redundant clauses in a partially saturated set is itself redundant.

```
lemma resolvent-upon-and-partial-saturation : assumes redundant P1 S assumes redundant P2 S assumes partial-saturation S A (S \cup R) assumes C = resolvent-upon P1 P2 A shows redundant C(S \cup R) \langle proof \rangle
```

We show that if R is a set of resolvents of a set of clauses S then the same holds for $S \cup R$. For the clauses in S, the premises are identical to the resolvent and the inference is thus redundant (this trick is useful to simplify proofs).

```
definition in-all-resolvents-upon:: 'at Formula \Rightarrow 'at \Rightarrow 'at Clause \Rightarrow bool where
```

```
in-all-resolvents-upon S A C = (\exists P1 P2. (P1 \in S \land P2 \in S \land C = resolvent-upon P1 P2 A))
```

```
lemma every-clause-is-a-resolvent:

assumes all-fulfill (in-all-resolvents-upon S A) R

assumes all-fulfill (\lambda x. \neg(tautology\ x)) S

assumes P1 \in S \cup R

shows in-all-resolvents-upon S A P1

\langle proof \rangle
```

We show that if a formula is partially saturated then it stays so when new resolvents are added in the set.

```
lemma partial-saturation-is-preserved:
assumes partial-saturation S E1 S
assumes partial-saturation S E2 (S \cup R)
assumes all-fulfill (\lambda x. \neg (tautology \ x)) S
assumes all-fulfill (in\text{-}all\text{-}resolvents\text{-}upon \ S E2) R
shows partial-saturation (S \cup R) E1 (S \cup R)
```

The next lemma shows that the clauses inferred by applying the resolution rule upon a given atom contain no occurrence of this atom, unless the inference is redundant.

```
lemma resolvents-do-not-contain-atom : assumes \neg tautology P1 assumes \neg tautology P2 assumes C = resolvent-upon P1 P2 E2 assumes \neg subsumes P1 C assumes \neg subsumes P2 C shows (Neg E2) \notin C \wedge (Pos E2) \notin C \wedge (proof)
```

The next lemma shows that partial saturation can be ensured by computing all (non-redundant) resolvents upon the considered atom.

```
lemma ensures-partial-saturation:
   assumes partial-saturation S E2 (S \cup R)
   assumes all-fulfill (\lambda x. \neg (tautology \ x)) S
   assumes all-fulfill (in-all-resolvents-upon S E2) R
   assumes all-fulfill (\lambda x. (\neg redundant \ x \ S)) R
   shows partial-saturation (S \cup R) E2 (S \cup R)
\langle proof \rangle

lemma resolvents-preserve-equivalence:
   shows equivalent S (S \cup (all-resolvents-upon \ S \ A))
\langle proof \rangle
```

Given a sequence of atoms, we define a sequence of clauses obtained by resolving upon each atom successively. Simplification rules are applied at each iteration step.

```
fun resolvents-sequence :: (nat \Rightarrow 'at) \Rightarrow 'at Formula \Rightarrow nat \Rightarrow 'at Formula where
(resolvents-sequence\ A\ S\ 0) = (simplify\ S)\ |
(resolvents-sequence\ A\ S\ (Suc\ N)) =
(simplify\ ((resolvents-sequence\ A\ S\ N)
\cup\ (all-resolvents-upon\ (resolvents-sequence\ A\ S\ N)\ (A\ N))))
```

The following lemma states that partial saturation is preserved by simplification.

```
lemma redundancy-implies-partial-saturation:

assumes partial-saturation S1 A S1

assumes S2 \subseteq S1

assumes all-fulfill (\lambda x. redundant x S2) S1

shows partial-saturation S2 A S2

\langle proof \rangle
```

The next theorem finally states that the implicate generation algorithm is sound and complete in the sense that the final clause set in the sequence is exactly the set of prime implicates of the considered clause set.

```
\begin{tabular}{ll} \textbf{theorem} & incremental\mbox{-}prime\mbox{-}implication\mbox{-}generation\mbox{:}\\ \textbf{assumes} & atoms\mbox{-}formula \mbox{ } S = \{\mbox{ } X. \mbox{ } \exists \mbox{ } I::nat. \mbox{ } I < N \mbox{ } \land \mbox{ } X = (A\mbox{ } I)\mbox{ } \}\\ \textbf{assumes} & all\mbox{-}fulfill\mbox{ } finite\mbox{ } S\\ \textbf{shows} & (prime\mbox{-}implicates\mbox{ } S) = (resolvents\mbox{-}sequence\mbox{ } A\mbox{ } S\mbox{ } N)\\ \langle proof \rangle \\ \end \\ \textbf{end} \\ \end \\ \end
```
