Abstract

This is a library of constructions on regular expressions and languages. It provides the operations of concatenation, Kleene star and left-quotients of languages. A theory of derivatives and partial derivatives is provided. Arden's lemma and finiteness of partial derivatives is established. A simple regular expression matcher based on Brozowski's derivatives is proved to be correct. An executable equivalence checker for regular expressions is verified; it does not need automata but works directly on regular expressions. By mapping regular expressions to binary relations, an automatic and complete proof method for (in)equalities of binary relations over union, concatenation and (reflexive) transitive closure is obtained.

For an exposition of the equivalence checker for regular and relation algebraic expressions see the paper by Krauss and Nipkow [3].

Extended regular expressions with complement and intersection are also defined and an equivalence checker is provided.
